(54) Title: METHIONINE SULFONE AND S-SUBSTITUTED CYSTEINE SULFONE DERIVATIVES AS ENZYME INHIBITORS

(57) Abstract

This invention relates to compounds which inhibit thrombin or factor Xa. The compounds contain an aldehyde functionality and a methionine sulfone or S-substituted cysteine sulfone residue. The compounds and their pharmaceutical compositions are useful for preventing thrombosis in mammals which are suspected of having a condition characterized by abnormal thrombosis.

DESCRIPTION

Methionine Sulfone and S-Substituted Cysteine Sulfone Derivatives as Enzyme Inhibitors

Related Applications

This application is a continuation-in-part of U.S. Serial No. 08/234,811, filed April 28, 1994 which is a continuation-in-part of U.S. Serial No. 08/229,298, filed April 18, 1994 the disclosures of which are hereby incorporated by reference herein, including the drawings attached thereto.

Technical Field.

In one aspect, the present invention relates to compounds which are potent inhibitors of thrombin or factor Xa. In another aspect, the present invention relates to novel peptide aldehyde analogs, their pharmaceutically acceptable salts, and pharmaceutically acceptable compositions thereof which are useful as potent and specific inhibitors of blood coagulation in vitro and in vivo in mammals. In yet another aspect, the invention relates to methods of using these inhibitors as therapeutic agents for disease states in mammals characterized by abnormal thrombosis.

Background.

Normal hemostasis is the result of a complex balance between the processes of clot formation (blood coagulation) and clot dissolution (fibrinolysis). The complex interactions between blood cells, specific plasma proteins and the vascular surface, maintain the fluidity of blood unless injury and blood loss occur.

Blood coagulation is the culmination of a series of amplified reactions in which several specific zymogens of

20

2

are activated by limited serine proteases in plasma proteolysis. Nemerson, Y. and Nossel, H.L., Ann. Rev. Med., This series of reactions results in the 33: 479 (1982). formation of an insoluble fibrin matrix which is required for the stabilization of the primary hemostatic plug. interaction and propagation of the activation reactions occurs through the extrinsic and intrinsic pathways of coagulation.

These pathways are highly inter-dependent and converge in the formation of the serine protease, Factor Xa. Xa catalyzes the penultimate step in the blood coagulation cascade which is the formation of the serine protease thrombin. This step occurs following the assembly of the prothrombinase complex which is composed of factor Xa, the 15 non-enzymatic co-factor Va and the substrate prothrombin assembled on the surface of adhered, activated platelets or systemically circulating membranous microparticles.

Proteolytic activation of zymogen factor X to its catalytically active form, factor Xa, can occur by either the intrinsic or extrinsic coagulation pathways.

The intrinsic pathway is referred to as "intrinsic" because everything needed for clotting is in the blood. Saito, H., "Normal Hemostatic Mechanisms", Disorders of Hemostasis, pp. 27-29, Grune & Stratton, Inc. (0. 25 Ratnoff, M.D. and C. D. Forbes, M.D. edit. 1984). pathway is comprised of the zymogen serine proteases, factors IX and XI, and the non-enzymatic co-factor, factor The initiation of the intrinsic pathway results in the activation of factor XI to XIa. Factor XIa catalyzes the activation of factor IX to factor IXa which 30 combination with the activated form of factor VIII on an appropriate phospholipid surface, results in the formation This complex also catalyzes the of the tenase complex. formation of the serine protease, factor Xa, zymogen, factor X which subsequently results in 35 formation.

The extrinsic pathway is referred to as "extrinsic"

because the tissue factor which binds to and facilitates the activation of factor VII comes from outside the blood. The major components of this pathway are the Saito, <u>Id</u>. zymogen serine protease, factor VII, and the membrane bound 5 protein, tissue factor. The latter serves as the requisite non-enzymatic co-factor for this enzyme. The initiation of this pathway is thought to be an autocatalytic event resulting from the activation of zymogen factor VII by trace levels of activated factor VII (factor VIIa), both of 10 which are bound to newly exposed tissue factor on membrane surfaces at sites of vascular damage. VIIa/tissue factor complex directly catalyzes the formation of the serine protease, factor Xa, from its zymogen, factor Exposure of blood to injured tissue initiates blood clotting by the extrinsic pathway. 15

The formation of thrombin is catalyzed by factor Xa following the assembly of the catalytic prothrombinase complex as reviewed by Mann, K. G. et. al., Dependent Reactions of the Vitamin K-Dependent Enzyme This complex Complexes", Blood, <u>76</u>: 1-16 (1990). 20 composed of factor Xa, the non-enzymatic co-factor Va and the substrate prothrombin all assembled on an appropriate The requirement of a macromolecular phospholipid surface. complex for efficient catalysis results in the protection 25 of factor Xa from natural anticoagulant mechanisms such as heparin-antithrombin III mediated inhibition. Teite, J. M. "Protection of Factor Xa from and Rosenberg, R. D., neutralization by the heparin-antithrombin complex", In addition, 71: 1383-1391(1983). Invest., 30 sequestration of factor Xa in the prothrombinase complex also renders it resistant to inhibition by exogenous heparin therapy which also requires antithrombin III to elicit its anticoagulant effect.

Thrombin is the primary mediator of thrombus formation. Thrombin acts directly to cause formation of insoluble fibrin from circulating fibrinogen. In addition, thrombin activates the zymogen factor XIII to the active

transglutaminase factor XIIIa which acts to covalently stabilize the growing thrombus by crosslinking the fibrin strands. Lorand, L. and Konishi, K., Arch. Biochem. Biophys., 105: 58 (1964). Beyond its direct role in the formation and stabilization of fibrin rich clots, the enzyme has been reported to have profound bioregulatory effects on a number of cellular components within the vasculature and blood. Shuman, M.A., Ann. NY Acad. Sci., 405: 349 (1986).

It is believed that thrombin is the most potent 10 agonist of platelet activation, and it has demonstrated to be the primary pathophysiologic-mediator of platelet-dependent arterial thrombus formation. Edit, J.F. et al., J. Clin. Invest., 84: 18 (1989). Thrombin-mediated 15 platelet activation leads to ligand-induced inter-platelet aggregation principally due to the bivalent interactions between adhesive ligands such as fibrinogen and fibronectin with platelet integrin receptors such as glycoprotein IIb/IIIa which assume their active conformation following 20 thrombin activation. Berndt, M.C. and Phillips, D.R., Platelets in Biology and Pathology, 43-74, pp Elsevier/North Holland Biomedical Press (Gordon, J.L. edit. Thrombin-activated platelets can also support 1981). further thrombin production through the assembly of new 25 prothrombinase and tenase (factor IXa, factor VIIIa and factor X) catalytic complexes on the membrane surface of activated platelets and platelet-derived intact microparticles, following thrombin-mediated activation of the non-enzymatic cofactors V and VIII, respectively. Tans, 30 G. et al., Blood, <u>77</u>: 2641 (1991). This positive feedback local generation of process results in the large concentrations of thrombin within the vicinity of thrombus which supports further growth and thrombus extension. Mann, K.G. et al., Blood, 76: 1 (1990).

In contrast to its prothrombotic effects, thrombin has been shown to influence other aspects of hemostasis. These

effect important physiological its as an include The anticoagulant effect of thrombin is anticoagulant. expressed following binding of thrombin to the endothelial cell membrane glycoprotein, thrombomodulin. 5 thought to result in an alteration of the substrate specificity of thrombin thereby allowing it to recognize and proteolytically activate circulating protein C to give activated protein C (aPC). Musci, G. et al., Biochemistry, 27: 769 (1988). aPC is a serine protease which selectively 10 inactivates the non-enzymatic co-factors Va and VIIIa resulting in a down-regulation of thrombin formation by the catalytic complexes, prothrombinase and tenase respectively. Esmon, C.T., Science, 235: 1348 (1987). activation of protein C by thrombin in the absence of 15 thrombomodulin is poor.

Thrombin has also been shown to be a potent direct mitogen for a number of cell types, including cells of mesenchymal origin such as vascular smooth muscle cells. Chen, L.B. and Buchanan, J.M., Proc. Natl. Acad. Sci. USA, 20 72: 131 (1975). The direct interaction of thrombin with vascular smooth muscle also results in vasoconstriction. Walz, D.A. et al., Proc. Soc. Expl. Biol. Med., 180: 518 (1985). Thrombin acts as a direct secretagogue inducing the release of a number of bioactive substances from 25 vascular endothelial cells including tissue plasminogen activator. Levin, E.G. et al., Thromb. Haemost., 56: 115 (1986). In addition to these direct effects on vascular cells, the enzyme can indirectly elaborate potent mitogenic activity on vascular smooth muscle cells by the release of 30 several potent growth factors (e.g. platelet-derived growth factor and epidermal growth factor) from platelet agranules following thrombin-induced activation. Ross, R., N. Engl. J. Med., 314: 408 (1986).

Many significant disease states are related to abnormal hemostasis. With respect to the coronary arterial vasculature, abnormal thrombus formation due to the rupture

of an established atherosclerotic plaque is the major cause of acute myocardial infarction and unstable angina. Moreover, treatment of an occlusive coronary thrombus by either thrombolytic therapy or percutaneous transluminal coronary angioplasty (PTCA) is often accompanied by an acute thrombotic reclosure of the affected vessel which requires immediate resolution. With respect to the venous vasculature, a high percentage of patients undergoing major surgery in the lower extremities or the abdominal area 10 suffer from thrombus formation in the venous vasculature which can result in reduced blood flow to the affected extremity and a predisposition to pulmonary embolism. Disseminated intravascular coagulopathy commonly occurs within both vascular systems during septic shock, certain 15 viral infections and cancer and is characterized by the rapid consumption of coagulation factors and systemic coagulation which results in the formation of threatening thrombi occurring throughout the vasculature leading to widespread organ failure.

Pathogenic thrombosis in the arterial vasculature is a 20 major clinical concern in today's medicine. leading cause of acute myocardial infarction which is one of the leading causes of death in the western world. Recurrent arterial thrombosis also remains one of the leading causes of failure following enzymatic or mechanical occluded coronary recanalization of thrombolytic agents or percutaneous transluminal coronary angioplasty (PTCA), respectively. Ross, A.M., Thrombosis in Cardiovascular Disorder, p. 327, W.B. Saunders Co. (Fuster, V. and Verstraete, M. edit. 1991); Califf, R.M. 30 and Willerson, J.T., Id. at p 389. In contrast thrombotic events in the venous vasculature, arterial thrombosis is the result of a complex interaction between fibrin formation resulting from the blood coagulation cascade and cellular components, particularly platelets, which make up a large percentage of arterial thrombi. Heparin, the most widely used clinical anticoagulant

administered i.v., has not been shown to be universally effective in the treatment or prevention of acute arterial thrombosis or rethrombosis. Prins, M.H. and Hirsh, J., J. Am. Coll. Cardiol., <u>67</u>: 3A (1991).

Besides the unpredictable, recurrent thrombotic reocclusion which commonly occurs following PTCA, a profound restenosis of the recanalized vessel occurs in 30 to 40% of patients 1 to 6 months following this procedure. Califf, R.M. et al., J. Am. Coll. Cardiol., <u>17</u>: 2B (1991).

10 These patients require further treatment with either a repeat PTCA or coronary artery bypass surgery to relieve the newly formed stenosis. Restenosis of a mechanically damaged vessel is not a thrombotic process but instead is the result of a hyperproliferative response in the surrounding smooth muscle cells which over time results in a decreased luminal diameter of the affected vessel due to increased muscle mass. Id. As for arterial thrombosis, there is currently no effective pharmacologic treatment for the prevention of vascular restenosis following mechanical recanalization.

The need for safe and effective therapeutic anticoagulants has in one aspect focused on the role of the serine protease thrombin in blood coagulation.

Most preferred natural substrates for thrombin are reported to contain an uncharged amino acid in the P3 recognition subsite. For example, the thrombin cleavage site on the A α chain of fibrinogen, which is the primary physiological substrate for thrombin, is reported to contain a glycine residue in this position while the cleavage site on the B β chain contains a serine, as shown below:

P4 P3 P2 P1 P1'

Gly-Gly-Val-Arg/Gly Fibrinogen Aa Chain

Phe-Ser-Ala-Arg/Gly Fibrinogen $B\beta$ Chain

Peptidyl derivatives having an uncharged residue in 35 the P3 position are said to bind to the active site of

thrombin and thereby inhibit the conversion of fibrinogen to fibrin and cellular activation have been reported. These derivatives have either an aldehyde, chloromethyl ketone or boronic acid functionality associated with the P1 example, substrate-like peptidyl 5 amino acid. For derivatives such as D-phenylalanyl-prolyl-argininal (D-Phe-D-phenylalanyl-prolyl-arginine-chloromethyl Pro-Arg-al), ketone (P-PACK) and acetyl-D-phenylalanyl-prolylboroarginine (Ac-(D-Phe)-Pro-boroArg) have been reported to inhibit thrombin by directly binding to the active site of the enzyme. Bajusz, S., Symposia Biologica Hungarica, 25: 277 (1984), Bajusz, S. et al, J. Med. Chem., <u>33</u>: 1729 (1990) and Bajusz, S. et al., Int. J. Peptide Protein Res. 12: 217 (1970); Kettner, C. and Shaw, E., Methods Enzymol., 15 80: 826 (1987), Kettner, C. et al., EP 293,881 (published December 7, 1988), Kettner, C., et al., J. Biol. Chem., 265: 18209 (1990). These molecules have been reported to be potent anticoagulants in the prevention of platelet-rich arterial thrombosis. Kelly, A.B. et al., 20 Haemostas., <u>65</u>: 736 at abstract 257 (1991). Other peptidyl aldehydes have been proposed or reported as inhibitors of thrombin. Bey, P. et al., EP 363,284 (published April 11, 1990) and Balasubramanian, N. et al., EP 526,877 (published February 10, 1993).

25 Peptidyl compounds which are said to be active site inhibitors of thrombin but which differ in structure from those containing a uncharged amino acid in the P3 recognition subsite have been reported.

The compound, Argatroban (also called 2R,4R-4-methyl
1-[N-2-(3-methyl-1,2,3,4-tetrahydro-8-quinolinesulfonyl)-L
argininal]-2-piperdinecarboxylic acid), is also reported to

bind directly to the active site of thrombin and has been

thought to be the most potent and selective compound in the

class of non-peptidyl inhibitors of this enzyme. Okamoto,

S. et al., Biochem. Biophys. Res. Commun., 101: 440 (1981).

Argatroban has been reported to be a potent antithrombotic

agent in several experimental models of acute arterial thrombosis. Jang, I.K. et al., in both Circulation, <u>81</u>: 219 (1990) and Circ. Res., <u>67</u>: 1552 (1990).

Peptidyl compounds which are said to be inhibitors of 5 thrombin and whose mode of action is thought to be by binding to both the active site and another site on the Hirudin and certain peptidyl enzyme have been reported. derivatives of hirudin have been reported to inhibit both conversion of fibrinogen to fibrin and platelet activation 10 by binding to either both the active site and exo site, or Markwardt, F., Thromb. the exo site only, of thrombin. Haemostas., 66: 141 (1991). Hirudin is reported to be a 65 amino acid polypeptide originally isolated from leech salivary gland extracts. It is said to be one of the most Marki, W.E. 15 potent inhibitors of thrombin known. Wallis, R.B., Thromb. Haemostas., <u>64</u>: 344 (1990). been reported to inhibit thrombin by binding to both its anion-binding exo-site and to its catalytic active site which are distinct and physically distant from each other. 20 Rydel, T.J. et al., Science, <u>249</u>:277 (1990). been reported to be a potent antithrombotic agent in vivo. Markwardt, F. et al., Pharmazie, 43: 202 (1988); Kelly, In addition to its (1991). A.B. et al., Blood, <u>77</u>: 1 antithrombotic effects, hirudin has been reported to also 25 effectively inhibit smooth muscle proliferation and the associated restenosis following mechanical damage to a atherosclerotic rabbit femoral artery. Sarembock, I.J. et al., Circulation, 84: 232 (1991).

Hirugen has been reported to be a peptide derived from the anionic carboxy-terminus of hirudin. It is reported to bind only to the anion binding exo-site of thrombin and thereby inhibit the formation of fibrin but not the catalytic turnover of small synthetic substrates which have access to the unblocked active site of the enzyme.

Maraganore, J.M. et al., J. Biol. Chem., 264: 8692 (1989); Naski, M.C. et al., J. Biol. Chem., 265: 13484 (1990). The

region of hirudin represented by hirugen has been reported, as according to by x-ray crystallographic analysis, to bind directly to the exo site of thrombin. Skrzypczak-Jankun, E. et al., Thromb. Haemostas., <u>65</u>: 830 at abstract 507 (1991). 5 Moreover, the binding of hirugen has also been reported to enhance the catalytic turnover of certain small synthetic substrates by thrombin, indicating that a conformational change in the enzyme active site may accompany occupancy of the exo-site. Liu, L.W. et al., J. Biol. Chem, 266:16977 Hirugen also is reported to block 10 (1991).thrombinmediated platelet aggregation. Jakubowski, Maraganore, J.M., Blood, 75: 399 (1990).

A group of synthetic chimeric molecules comprised of a hirugen-like sequence linked by a glycine-spacer region to the peptide, D-phenylalanyl-prolyl-arginine, which is based on a preferred substrate recognition site for thrombin, has been termed to be hirulog. Maraganore et al., U.S. Patent No. 5,196,404 (March 23, 1993). The hirugen-like sequence is said to be linked to this peptide through the C-terminal 20 end of the peptide. Maraganone, J.M. et al., Biochemistry, 29: 7095 (1990). The hirulogs have been reported to be an effective antithrombotic agents in preventing both fibrin-Maraganone, J.M. rich and platelet-rich thrombosis. al., Thromb. Haemostas., 65: 651 at abstract 17 (1991).

15

 $(CH_2)_m$ -Ar- CHN_4

wherein m is 1, 2, 3, 4, 5 or 6; q is 0, 1 or 2 and Ar is a divalent aryl group of 6 to 14 carbon atoms; and

(d) n is 1, 2 or 3; or pharmaceutically acceptable salts thereof.

Peptidyl arginine aldehydes have been reported to exist in equilibrium structures in aqueous solutions.

Bajusz, S., et al., J. Med. Chem., 33: 1729 (1990). These structures, as shown below, include the arginine aldehyde, A, aldehyde hydrate, B, and two amino cyclol forms, C and D. The R group would represent the remainder of a given compound embodied in the present invention. The peptide aldehydes of the present invention include within their definition all the equilibrium forms.

In another aspect, the present invention is directed to pharmaceutical compositions comprising a therapeutically 5 effective amount of a compound of the present invention and a pharmaceutically acceptable carrier.

In yet another aspect, the present invention is directed to methods of using the compounds and pharmaceutical compositions of the present invention for the prevention of thrombosis in a mammal suspected of having a condition characterized by abnormal thrombosis, comprising administering to said mammal a therapeutically effective amount of a compound the present invention or pharmaceutical composition comprising such a compound.

Definitions.

15

20

In accordance with the present invention and as used herein, the following terms are defined to have following meanings, unless explicitly stated otherwise.

The term "alkyl" refers to saturated aliphatic groups including straight-chain, branched-chain and cyclic groups.

The term "alkoxy" refers to a group having the formula, R-O-, wherein R is an alkyl group.

The term "alkenyl" refers to unsaturated aliphatic 25 groups which contain at least one carbon-carbon double bond

and includes straight-chain, branched-chain and cyclic groups.

The term "alkenyloxy" refers to a group having the formula, R-O-, wherein R is an alkenyl group.

The term "aryl" refers to aromatic groups which have at least one ring having a conjugated pi electron system and includes carbocyclic aryl, heterocyclic aryl and biaryl groups, all of which may be optionally substituted.

The term "aryloxy" refers to a group having the 10 formula, R-O-, wherein R is an aryl group.

The term "aralkyl" refers to an alkyl group substituted with an aryl group. Suitable aralkyl groups include benzyl, picolyl, and the like, all of which may be optionally substituted.

15 The term "aralkoxy" refers to a group having the formula, R-O-, wherein R is an aralkyl group.

The term "aralkenyl refers to an alkenyl group substituted with an aryl group. Suitable aralkenyl groups include styrenyl and the like, all of which may be 20 optionally substituted.

The term "aralkenyloxy" refers to a group having the formula, R-O-, wherein R is an aralkenyl group.

The term "alkylene" refers to a divalent straight chain or branched chain saturated aliphatic radical.

25 The term "alkylenecarboxy" refers to the group -alk-COOH where alk is alklene.

The term "alkylene aryl" refers to the group -alk-Ar where alk is alkylene and Ar is a divalent aryl group.

The term "carboxamide" refers to the group -C(=0)-NH2.

30 The term "alkylenecarboxamide" refers to the group -alk-C(=0)-NH2 where alk is alkylene.

The term "alkylenehydroxy" refers to the group -alk-OH wherein alk is alkylene.

The term "amino acid" refers to both natural and 35 unnatural amino acids. Natural amino acids include alanine (Ala), arginine (Arg), asparagine (Asn), aspartic acid (Asp), cysteine (Cys), glutamine (Gln), glutamic acid

(Glu), glycine (Gly), histidine (His), isoleucine (Ile), methionine (Lys), lysine (Leu), leucine phenylalanine (Phe), proline (Pro), serine (Ser), threonine (Thr), tryptophan (Trp), tyrosine (Tyr) and valine (Val). 5 Unnatural amino acids include, but are not limited to azetidinecarboxylic acid, 2-aminoadipic acid, 3-aminoadipic beta-alanine, aminopropionic acid, 2-aminobutyric acid, 4-aminobutyric acid, 6-aminocaproic acid, 2-aminoheptanoic acid, 2-aminoisobutyric acid, 3-aminoisobutyric 10 acid, 2-aminopimelic acid, 2,4 diaminoisobutyric acid, desmosine, 2,2'-diaminopimelic acid, 2,3-diaminopropionic N-ethylglycine, N-ethylasparagine, hydroxylysine, allo-hydroxylysine, 3-hydroxyproline, 4-hydroxyproline, N-methylglycine, allo-isoleucine, isodesmosine, 15 methylisoleucine, N-methylvaline, norvaline, norleucine, ornithine and pipecolic acid.

The term "amino acid residue" refers to -NH-CH(R)-CO-, wherein R is the side chain group distinguishing each amino

(CH₂)_x

The term "methylene" refers to -CH2-.

The term "perfluoroalkyl refers to an alkyl group wherein each hydrogen is replaced by a fluoro. Suitable 25 perfluoroalkyl groups include perfluoromethyl (having the structure of CF3-) and perfluroethyl (having the structure of CF3-CF2-) and the like.

The term "perfluoroaryl refers to an aryl group wherein each hydrogen is replaced by a fluoro. Suitable 30 perfluoroaryl groups include perfluorophenyl (having the

formula of

and 2-perfluoronaphthyl (having the

20

In addition, the following abbreviations stand for the following:

"AIBN" refers to

"N-Boc-N g -nitro-L-arginine" refers to the compound which has the formula:

"Arg-al" refers to L-argininal which has the formula:

"Arg-ol" refers to L-argininol which has the formula:

15

"Azt" refers to L-2-azetidinecarboxylic acid.

"Bzl" refers to benzyl.

"BzlSO2" refers to benzylsulfonyl.

20 "Boc" refers to t-butoxycarbonyl.

"BOP" refers to benzotriazol-1-yloxy-tris-(dimethylamino)-phosphonium-hexafluorophosphate.

"Brine" means an aqueous saturated solution of sodium chloride.

"BuSO2" refers to 1-butanesulfonyl.

"d-camphor-SO2" refers to d-10-camphorsulfonyl which

5 has the formula:

"l-camphor-SO2" refers to l-10-camphorsulfonyl which has the formula:

10 "CDI" refers to carbonyldiimidazole.

"CHN4" refers to tetrazolyl.

"ChxCH2SO2" refers to cyclohexylmethanesulfonyl.

"ChxNHSO2" refers to N-cyclohexylaminosulfonyl.

"2-CMPhSO2" refers to 2-carbomethoxy-1-phenylsulfonyl.

"Cys[S-CH3]" refers to S-methyl-L-cysteine which has the formula:

"Cys[S(O)-CH3]" refers to S-methyl-L-cysteine sulfoxide which has the formula:

20

"Cys[$S(O_2)$ -CH3]" refers to S-methyl-L-cysteine sulfone which has the formula:

5 "Cys[S-CH2CO2H]" refers to S-(carboxymethyl)-L-cysteine which has the formula:

"Cys[S(O)-CH2CO2H]" refers to S-(carboxymethyl)-L10 cysteine sulfoxide which has the formula:

"Cys[S(O2)-CH2CO2H]" refers to S-(carboxymethyl)-L-cysteine sulfone which has the formula:

15

"Cys[S-CH2CO2CH3] refers to S-(carbomethoxymethyl)-L-cysteine which has the formula:

"Cys[S(O)-CH2CO2CH3] refers to S-(carbomethoxymethyl)-L-cysteine sulfoxide which has the formula:

"Cys[S(O2)-CH2CO2CH3] refers to S-(carbomethoxymethyl)

-L-cysteine sulfone which has the formula:

10

"Cys[(S-CH2Tzl] refers to S-(tetrazol-5-ylmethyl)-L-cysteine which has the formula:

"Cys[S(O)-CH2Tzl] refers to S-(tetrazol-5-yl)-L-cysteine methyl sulfoxide which has the formula:

"Cys[S(O₂)-CH₂Tzl] refers to S-(tetrazol-5-yl)-L-cysteine methyl sulfone which has the formula:

"DCC" refers to 1,3-dicyclohexylcarbodiimide.

"DCM" refers to dichloromethane.

"DIEA" refers to diisopropylethylamine.

10 "DMF" refers to N, N-dimethylformamide.

"EDC" refers to ethyl-3-(3-dimethylamino)-propyl-carbodiimide hydrochloride salt.

"HBTU" refers to 2-(1H benzotriazol-l-yl)-1,1,3,3-tetramethyluronium hexafluorophosphate.

"HOBt" refers to 1-hydroxybenzotriazole monohydrate.

"MeOH" refers to methanol.

"Met[S(O)]" refers to L-methionine sulfoxide which has the formula:

20

15

"Met[$S(O_2)$]" refers to L-methionine sulfone which has the formula:

25

"MgSO4" refers to anhydrous magnesium sulfate.

"MeOH" refers to methanol.

"1-NpSO2" refers to 1-naphthalenesulfonyl.

5 "2-NpSO2" refers to 2-naphthalenesulfonyl.

"NMP" refers to N-methylpiperidine.

"NMM" refers to 4-methylmorpholine.

"Ph" refers to phenyl.

"Pip" refers to L-pipecolic acid.

10 "Pro" refers to L-proline.

"2-PrPen" refers to 2-propylpentanoyl.

"TBTU" refers to 2-(1H-benzotriazol-1-yl)-1,1,3,3tetramethyluronium tetrafluoroborate.

"TEA" refers to triethylamine.

"TFA" refers to trifluoroacetic acid.

"THF" refers to tetrahydrofuran.

Brief Description of the Drawings.

Figure 1 depicts a reaction scheme describing a 20 process for preparing a solid-phase reagent which may be used to make the compounds of the present invention. In this figure, Bzl refers to benzyl; t-Bu refers to t-butyl; and Boc refers to t-butoxycarbonyl.

preferred solution phase synthesis route for preparing the peptide aldehydes of the present invention. In this figure, Boc refers to t-butoxycarboxyl, Et refers to ethyl, Me refers to methyl and R₁, R₂ and X are as defined in connection with formula (I). In this figure, (i) to (xii) denote the following reaction conditions, reagents and/or solvents: (i) N-methylpiperidine, isobutylchloroformate, 5°C; (ii) N-methyl-O-methylhydroxylamine hydrochloride, N-

methylpiperidine, 5°C; (iii) lithium aluminum hydride, tetrahydrofuran, -60°C; (iv) potassium bisulfate, -30°C; (v) hydrochloric acid, ethanol; (vi) ethanol, hydrogen chloride(g); (vii) dimethylformamide/acetonitrile, HBTU, HOBT, 0°C; (viii) 4-methyl-morpholine; (ix) methanol/water/acetic acid, hydrogenation catalyst (such as Pd/C); (x) acetonitrile/water, hydrochloric acid, 0°C; (xi) aqueous sodium acetate; and (xii) tetrohydrofuran, piperidine.

Figure 3 depicts the anticoagulant effect of the compound of Example 27, BzlSO2-Met[S(O2)]-Pro-Arg-al, measured in citrated rat (1) and human (m) plasma using the activated partial thromboplastin time (APTT) assay. The elevation in APTT due to increasing concentration of compound is presented relative to the control clotting time for rat (19.75 sec) and human (28.3 sec) plasma which is set to a value of 1.0.

Detailed Description of the Invention.

20 1. Preferred Compounds.

In one aspect, the present invention is directed to certain compounds which are the peptide aldehydes as depicted in formula (IA) below:

$$P_4$$
 P_3
 P_2
 P_3
 P_4
 P_3
 P_4

wherein

- (a) X is selected from the group consisting of -C(O)-, -S(O₂)-,-O-C(O)-,-NH-C(O)-, -O-S(O₂)-, -NH-S(O₂) 5 and -N(R')-S(O₂)-, wherein R' is alkyl of 1 to about 4 carbon atoms, aryl of about 6 to about 14 carbon atoms, or aralkyl of about 6 to about 15 carbon atoms;
 - (b) R_1 is selected from the group consisting of:
- 10 (1) alkyl of about 3 to about 10 carbon atoms,
 - (2) alkyl of 1 to about 3 carbon atoms substituted with cyclic alkyl of about 5 to about 8 carbon atoms,
- 15 (3) alkenyl of about 3 to about 6 carbon atoms,
 - (4) alkenyl of about 3 to about 6 carbon atoms which is substituted with cyclic alkyl of about 5 to about 8 carbon atoms,
- 20 (5) aryl of about 6 to about 14 carbon atoms,
 - (6) aryl of about 6 to about 14 carbon atoms which is substituted with Y1,
- (7) aryl of about 6 to about 14 carbon 25 atoms which is substituted with Y1 and Y2, or Y1, Y2 and Y3.
 - (8) aralkyl of about 6 to about 15 carbon atoms,
- (9) aralkyl of about 6 to about 15 carbon 30 atoms which is substituted in the aryl ring with Y1,
 - (10) aralkyl of about 6 to about 15 carbon atoms which is substituted in the aryl ring with Y_1 and Y_2 , or Y_1 , Y_2 and Y_3 .
- (11) aralkenyl of about 8 to about 15 as carbon atoms,
 - (12) aralkenyl of about 8 to about 15

carbon atoms which is substituted in the aryl ring with Y1,

(13) aralkenyl of about 8 to about carbon atoms which is substituted in the aryl ring with Y1 5 and Y2, or Y1, Y2 and Y3.

(14) perfluoroalkyl of 1 to about carbon atoms,

(15) perfluoroaryl of about 6 to about 14 carbon atoms,

10 (16) trimethylsilylalkyl of about about 8 carbon atoms,

wherein m is 1, 2, 3, 4, 5 or 6; q is 0, 1 or 2 and Ar is a divalent aryl group of 6 to 14 carbon atoms; and

(d) n is 1, 2 or 3; or pharmaceutically acceptable salts thereof.

Compounds of formula (IA) include those wherein P2 is L-2-azetidinecarboxylic acid, L-proline or L-pipecolic acid. Preferred compounds include those wherein P2 is L-15 2-azetidinecarboxylic acid or L-proline. Especially preferred compounds include those wherein P2 is L-proline.

The compounds of formula (IA) include those wherein P3 is: (1) L-cysteine which is substituted on its sulfur atom with a methyl, straight-chain alkylene of 1 to about 20 6 carbon atoms or alkylene aryl, wherein said straightchain alkylene or alkylenearyl is substituted with -C(0)--C(0)-OR', $-C(0)-NH_2$, -C(0)-NHR', -C(0)-NR'R", or R" are independently tetrazol-5-yl, wherein R' and selected from the group consisting of alkyl of 1 to about 25 4 carbon atoms, aryl of about 6 to about 14 carbon atoms, or aralkyl of about 6 to about 15 carbon atoms; (2) Lcysteine sulfoxide which is substituted on its sulfur atom with a methyl, straight-chain alkylene of 1 to about 6 carbon atoms, or alkylene aryl wherein said straight-chain 30 alkylene or alkylene aryl is substituted with -C(0)-OH, -C(0)-NR'R''-C(0)-OR', $-C(0)-NH_2$, -C(O)-NHR', tetrazol-5-yl; (3) L-cysteine sulfone which is substituted on its sulfur atom with a methyl or straight-chain alkylene of 1 to about 6 carbon atoms, or alkylene aryl 35 wherein said straight-chain alkylene or alkylene aryl is substituted with -C(0)-OH, -C(0)-OR', $-C(0)-NH_2$, -C(0)-

NHR', -C(O)-NR'R", or tetrazol-5-yl; (4) L-methionine; (5) L-methionine which is substituted on its S-methyl group with a straight-chain alkylene of 1 to about 6 carbon atoms, alkylene aryl or a divalent aryl group wherein said 5 straight-chain alkylene, alkylene aryl, or divalent aryl group is substituted with -C(0)-OH, -C(0)-OR, $-C(0)-NH_2$, -C(O)-NR'R", or tetrazol-5-y1; -C(O)-NHR', methionine sulfoxide; (7) L-methionine sulfoxide which is substituted on its S-methyl group with a straight-chain 10 alkylene of 1 to about 6 carbon atoms, alkylene aryl or divalent aryl group, wherein said straight-chain alkylene, alkylene aryl or divalent aryl group is substituted with -C(0)-OH, -C(0)-O-R', $-C(0)-NH_2$, -C(0)-NHR', -C(0)-NR'R'', or tetrazol-5-yl; (8) L-methionine sulfone; or (9) L-15 methionine sulfone which is substituted on its S-methyl group with a straight-chain alkylene of 1 to about 6 carbon atoms, alkylene aryl or divalent aryl gorup wherein said straight-chain alkylene, alkylene aryl or divalent aryl group is substituted with -C(0)-OH, -C(0)-0-R', $-C(0)-NH_2$, -C(0)-NHR', -C(0)-NR'R", or tetrazol-5-yl. Suitable alkylene aryl groups those having 1 to 6 carbons in the alkylene group and from about 6 to 14 carbons in Suitable divalent aryl groups have the divalent aryl. from 6 to 14 carbon atoms.

Preferred compounds include those wherein the amino acid residue at P3 is: (1) L-cysteine which is substituted on its sulfur atom with a straight-chain alkylene of 1 to 3 carbon atoms, wherein said straight-chain alkylene is substituted with -C(0)-OH, -C(0)-O-CH3, -C(0)-O-CH2-CH3, -C(0)-O-CH2-CH3, or tetrazol-5-yl; (2) L-cysteine sulfoxide which is substituted on its sulfur atom with a methyl or straight-chain alkylene of 1 to 3 carbon atoms, wherein said straight-chain alkylene is substituted with -C(0)-OH, -C(0)-O-CH3, -C(0)-O-CH2-CH3, -C(0)-O-CH2-CH2-CH2-CH3, or tetrazol-5-yl; (3) L-cysteine sulfone which is substituted on its sulfur atom with a methyl or straight-

chain alkylene of 1 to 3 carbon atoms, wherein said straight-chain alkylene is substituted with -C(0)-OH, $-C(0)-O-CH_3$, $-C(0)-O-CH_2-CH_3$, $-C(0)-O-CH_2-CH_2-CH_3$, tetrazol-5-yl; (4) L-methionine; (5) L-methionine which is 5 substituted on its S-methyl group with a straight-chain alkylene of 1 to 3 carbon atoms, wherein said straightchain alkylene is substituted with -C(0)-OH, -C(0)-O-CH3, $-C(0)-O-CH_2-CH_3$, $-C(0)-O-CH_2-CH_2-CH_3$, or tetrazol-5-yl; (6) L-methionine sulfoxide; (7) L-methionine sulfoxide 10 which is substituted on its S-methyl group with a straight-chain alkylene of 1 to 3 carbon atoms, wherein said straight-chain alkylene is substituted with -C(0)-OH, $-C(0)-O-CH_3$, $-C(0)-O-CH_2-CH_3$, $-C(0)-O-CH_2-CH_2-CH_3$, tetrazol-5-yl; (8) L-methionine sulfone; 15 methionine sulfone which is substituted on its S-methyl group with a straight-chain alkylene of 1 to 3 carbon atoms, wherein said straight-chain alkylene is substituted with -C(0)-OH, $-C(0)-O-CH_3$, $-C(0)-O-CH_2-CH_3$, $-C(0)-O-CH_2-CH_3$ CH2-CH3, or tetrazol-5-yl.

Also preferred are compounds wherein the amino acid residue at P3 has an alkylene aryl substituent attached to the sulfur atom, and substituted with -C(O)-OH, -C(O)OR', -C(O)NH2, -C(O)NHR', or -C(O)NR'N". Especially preferred substituted alkylene aryl include those where the alkylene moiety is -CH2- or -CH2CH2- and Ar is a divalent phenyl group.

Especially preferred compounds include those wherein p3 is L-methionine sulfone, S-methyl-L-cysteine sulfone, S-(carboxymethyl)-L-cysteine sulfone, S(carbomethoxy-methyl)-L-cysteine sulfone, S-(carboethoxymethyl)-L-cysteine sulfone, or S-(carbopropyloxymethyl)-L-cysteine sulfone.

Compounds of formula (IA) include those wherein P4 is $R_1-C(O)-$, $R_1-S(O_2)-$, $R_1-O-S(O_2)-$, $R_1-NH-S(O_2)-$ or 35 $R_1-N(R')-S(O_2)-$.

Preferred compounds include those wherein R1 is alkyl

of about 3 to about 10 carbon atoms; alkyl of 1 to about 3 carbon atoms substituted with cyclic alkyl of about 5 to about 8 carbon atoms; aryl of about 6 to about 14 carbon atoms; aryl of about 6 to about 14 carbon atoms which is substituted with Y1; aryl of about 6 to about 14 carbon atoms which is substituted with Y1 and Y2; aralkyl of about 6 to about 15 carbon atoms; aralkyl of about 6 to about 15 carbon atoms; aralkyl of about 6 to about 15 carbon atoms which is substituted in the aryl ring with Y1; aralkyl of about 6 to about 15 carbon atoms

Suitable alkyls for R1 include 1-propyl, 2-methyl-1-2-methyl-2-2-propyl, 2,2-dimethyl-1-propyl, propyl, 1-butyl, 2-butyl, 3-butyl, 3-methy-1-butyl, 1propyl, 15 pentyl, cyclopentyl, 1-hexyl, cyclopentylmethyl, cyclocyclohexylmethyl, 1-heptyl, octyl, 4-heptyl, hexyl, adamantylmethyl. dodecanyl, adamantyl or nonanyl, include cyclopentyl, Suitable cyclic alkyls pentylmethyl, cyclohexyl, cyclohexylmethyl, adamantyl and Suitable aryl groups for R1 include 20 adamantylmethyl. phenyl, 2-carboxyphenyl, 2-carbomethoxyphenyl, 2-indanyl, 2-indenyl, 1-naphthyl, 2-naphthyl, 2-thienyl, 2-pyrrolyl Suitable aralkyl groups include benzyl, or 2-furyl. diphenylmethyl, biphenylmethyl, naphthylmethyl, alpha-25 phenylmethylphenyl and 2-phenylethylene.

Where P3 is L-methionine sulfone, preferred compounds of formula (IA) include those wherein P4 is R_1 -S(O₂)-, R_1 -O-S(O₂)-, R_1 -NH-S(O₂)- or R_1 -C(O)-. Especially preferred compounds include those wherein P4 is R_1 -S(O₂)- or R_1 -C(O)-.

Where P4 is R_1 -S(O₂)-, preferred compounds include those wherein R_1 is alkyl of about 3 to about 10 carbon atoms, alkyl of 1 to about 3 carbon atoms substituted with

cyclic alkyl of about 5 to about 8 carbon atoms, aryl of about 6 to about 14 carbon atoms, aryl of about 6 to about 14 carbon atoms which is substituted with Y1, aryl of about 6 to about 14 carbon atoms which is substituted with 5 Y₁ and Y₂, aralkyl of about 6 to about 15 carbon atoms, aralkyl of about 6 to about 15 carbon atoms which is substituted in the aryl ring with Y1, or aralkyl of about 6 to about 15 carbon atoms which is substituted in the aryl ring with Y1 and Y2. Especially preferred compounds 10 include those wherein R1 is aryl of about 6 to about 14 carbon atoms, or aryl of about 6 to about 14 carbon atoms More especially preferred which is substituted with Y1. compounds include those wherein R1 is phenyl, 2carboxyphenyl, 2-carbomethoxyphenyl, 1-naphthyl 15 naphthyl.

Where P4 is R1-C(0)-, preferred compounds include those wherein R1 is alkyl of about 3 to about 10 carbon atoms, alkyl of 1 to about 3 carbon atoms substituted with cyclic alkyl of about 5 to about 8 carbon atoms, aralkyl of about 6 to about 15 carbon atoms, aralkyl of about 6 to about 15 carbon atoms which is substituted in the aryl ring with Y1, or aralkyl of about 6 to about 15 carbon atoms which is substituted in the aryl ring with Y1 and Y2. Especially preferred compounds include those wherein R1 is alkyl of about 3 to about 10 carbon atoms. More especially preferred compounds include those wherein R1 is 1-butyl, 1-heptyl or 4-heptyl.

Alternatively, where P3 is S-methyl-L-cysteine sulfone, preferred compounds of formula (IA) include those 30 wherein P4 is R₁-S(O₂)-, R₁-NH-S(O₂)- or R₁-C(O)-. Especially preferred compounds include those wherein P4 is R₁-S(O₂)-.

Where P4 is R_1 -S(O₂)-, preferred compounds include those wherein R_1 is alkyl of about 3 to about 10 carbon atoms, alkyl of 1 to about 3 carbon atoms substituted with

cyclic alkyl of about 5 to about 8 carbon atoms, aryl of about 6 to about 14 carbon atoms, aryl of about 6 to about 14 carbon atoms which is substituted with Y1, aryl of about 6 to about 14 carbon atoms which is substituted with Y1 and Y2, aralkyl of about 6 to about 15 carbon atoms, aralkyl of about 6 to about 15 carbon atoms which is substituted in the aryl ring with Y1, or aralkyl of about 6 to about 15 carbon atoms which is substituted in the aryl ring with Y1 and Y2. Especially preferred compounds include those wherein R1 is aryl of about 6 to about 14, or aryl of about 6 to about 14 carbon atoms which is substituted with Y1. More especially preferred compound include those wherein R1 is phenyl, 2-carboxyphenyl, 2-carboxyphenyl, 1-naphthyl or 2-naphthyl.

Alternatively, where S-(carboxymethyl)-L-₽3 is 15 S-(carbomethoxymethyl)-L-cysteine sulfone, cysteine sulfone, S-(carboethoxymethyl)-L-cysteine sulfone, or Spreferred (carbopropyloxymethyl)-L-cysteine sulfone, compounds of formula (IA) include those wherein P4 is R1-Especially preferred $S(O_2)$ -, R_1 -NH- $S(O_2)$ - or R_1 -C(O)-. 20 compounds include those wherein P3 is S-(carboxymethyl)-L-S-(carbomethoxymethyl)-L-cysteine cysteine sulfone or sulfone and P4 is $R_1-S(O_2)-$ or $R_1-C(O)-$.

Where P3 is S-(carboxymethyl)-L-cysteine sulfone or S-(carbomethoxymethyl)-L-cysteine sulfone and P4 is R1-S(O2)-, preferred compounds include those wherein R1 is alkyl of about 3 to about 10 carbon atoms, alkyl of 1 to about 3 carbon atoms substituted with cyclic alkyl of about 5 to about 8 carbon atoms, aryl of about 6 to about 14 carbon atoms which is substituted with Y1, aryl of about 6 to about 14 carbon atoms which is substituted with Y1, aryl of about 6 to about 14 carbon atoms which is substituted with Y1 and Y2, aralkyl of about 6 to about 15 carbon atoms, aralkyl of about 6 to about 15 ring with Y1, or aralkyl of about 6 to about 15 carbon atoms which is substituted in the aryl ring with Y1, or aralkyl of about 6 to about 15 carbon atoms which is substituted in the aryl ring with Y1 and Y2. Especially preferred compounds include those wherein

R1 is aryl of about 6 to about 14 carbon atoms, or aryl of about 6 to about 14 carbon atoms which is substituted with More especially preferred compounds include those wherein P3 is S-(carboxymethyl)-L-cysteine sulfone and R1 is phenyl, 1-naphthyl or 2-naphthyl. More especially preferred compounds also include those wherein P3 is S-(carbomethoxymethyl)-L-cysteine sulfone and R1 is phenyl, 2-carboxyphenyl, 2-carbomethoxyphenyl, 1-naphthyl or 2naphthyl.

Where P3 is S-(carboxymethyl)-L-cysteine sulfone or S-(carbomethoxymethyl)-L-cysteine sulfone and P4 is R1-C(0)-, preferred compounds include those wherein R1 alkyl of about 3 to about 10 carbon atoms, alkyl of 1 to about 3 carbon atoms substituted with cyclic alkyl of about 5 to 15 about 8 carbon atoms, aralkyl of about 6 to about 15 carbon atoms, aralkyl of about 6 to about 15 carbon atoms which is substituted in the aryl ring with Y1, or aralkyl of about 6 to about 15 carbon atoms which is substituted in the aryl ring with Y1 and Y2. Especially preferred 20 compounds include those wherein R1 is alkyl of about 3 to More especially preferred carbon atoms. about 10 compounds include those wherein R1 is 1-butyl, 1-heptyl or 4-heptyl.

Certain preferred compounds of the present invention include: 25

Also preferred are compounds having a substituted alkylene aryl group attached to the sulfur of the P3 amino acid. Especially preferred compounds include those of Examples 139 and 144.

2. Preparation of Preferred Compounds.

The compounds of the present invention are synthesized 10 by either solid or liquid phase methods. Under certain conditions, the liquid phase method disclosed herein is preferred.

Many of the starting materials used in either of these methods are readily available from chemical vendors as Aldrich, Sigma, Nova Biochemicals and the like.

During the synthesis of these compounds, the functional groups of the amino acid derivatives used in these methods are protected by blocking groups to prevent cross reaction during the coupling procedure. Examples of suitable blocking groups and their use are described in "The Peptides: Analysis, Synthesis, Biology", Academic Press, Vol. 3 (E. Gross & Meienhofer edit. 1981) and Vol. 9 (S. Udenfriend & J. Meienhofer edit. 1987), the disclosure of which are incorporated herein by reference.

The compounds of the present invention are synthesized by solid phase procedures described in the literature (see below) or by sequential chemical attachment of amino acid derivatives using the solid phase synthesis reagents and methods disclosed in the commonly assigned U.S. patent of

15

Webb, T.R., U.S. No 5,283,293 (issued February 1, 1994), and the commonly assigned U.S. patent application of Webb, T.R., U.S. Serial No. 07/807,474, filed December 13, 1991, the disclosures of which are incorporated herein by reference.

Figure 1 illustrates the synthesis of a solid phase reagent of Webb. This reagent is preferred for use in the solid phase method of Webb to make the compounds of the present invention. The details of how this reagent is made are provided in Examples 1 to 7.

Example 8 provides a preferred solid phase method to make the compounds of the present invention. method, the compound in its protected form is synthesized on a solid phase resin by the sequential coupling (using 15 BOP or TBTU in combination with HOBt) of the amino acids or amino acid derivatives which comprise the sequence of the desired final compound. The compound is removed from the solid phase in the form of a deprotected semicarbazone by treatment with hydrofluoric acid/anisole. This treatment, in addition to removing the compound from the resin as a semicarbazone, deprotects by removing O-t-butyl and N-nitro protecting groups from the amino acid or amino acid chain groups. The deprotected semicarbazone is then transformed by hydrolysis to a compound of the present invention 25 by treatment with ethylacetoacetate in a pH 1 mixture of acetic acid, tetrahydrofuran and water. Examples 11, 18, 21, 24, 27, 40, 43, 46, 49, 56, 59, 66 and 69 are provided to further demonstate the use of this solid phase synthesis method.

The peptide aldehydes of the present invention may also be synthesized by solution phase methods.

One preferred method is provided in Examples 28 through 33. In this method, N-Boc-Ng-nitro-L-arginine is first converted to N-Boc-Ng-nitro-L-argininol by treatment with borane-tetrahydrofuran complex. Next, N-Boc-Ng-nitro-L-argininol is converted to Ng-nitro-L-argininol by treatment with hydrochloric acid. Next, Ng-nitro-L-argininol

30

35

55

having a free N-terminal amino group is coupled to a presynthesized dipeptide having a free C-terminal carboxyl and a blocked N-terminal amino group dipeptide-Ng-nitro-L-argininol which is further converted 5 to dipeptide-L-argininol by hydrogenation (on palladium on Finally, the dipeptide-L-argininol is converted to the compound of the present invention, dipeptide-Largininal, by oxidation of the alcohol moiety of dipeptide-L-argininol to an aldehyde moiety using dichloroacetic acid and EDC in dimethylsulfoxide/toluene.

Another solution phase method for preparing peptide aldehydes is set forth in the commonly assigned and copending United States Patent Application Serial No. 08/261,380 "Methods of Synthesis of Peptide Argininals" 1994, the disclosure 17. οf 15 filed June incorporated herein by reference.

A preferred solution phase method for preparing peptide aldehydes of the present invention is depicted in Figure 2 and specific Examples are set forth in Examples to According this method, N-alpha-t-144. butoxycarbonyl-Ng-nitro arginine is converted to a Ng-nitro-L-argininal ethyl cyclol salt. The free alpha-amino of the cyclic argininal is then coupled to a pre-synthesized dipeptide having a free C-terminal carboxyl group and a 25 blocked N-terminal amino group to give a dipeptide-nitro cycloargininal ethyl ether, which is converted to the dipeptide cycloargininal ethyl ether by hydrogenation using a suitable hydrogenation catalyst such as palladium on The hydrolysis of the cyclic argininal ring gives the product peptide argininal.

As depicted in Figure 2, N-alpha-t-butoxycarbonyl-N9nitro-L-arginine Al is converted to the corresponding Nalpha-t-butoxycarbonyl-Ng-nitro-arginine-(N-methyl, methoxyamide) A2 by a two step method. A solution of A1 in solvent, suitably tetrahydrofuran, is cooled and then Nmethylpiperidine, followed by isobutyl chloroformate are To the resulting mixture, a cooled free base added.

solution of N-methyl-O-methylhydroxylamine free base is slowly added. The free base solution is prepared in advance by treating a cooled mixture of N-methyl-O-methylhydroxylamine hydrochloride in solvent, suitably methylene chloride, with N-methylpiperidine. All procedures are carried out under nitrogen. The reaction is perferably carried out at about -5°C. After the reaction is complete as determined by thin layer chromatography, the product A2 is isolated by conventional procedures such as filtration, concentration under vacuum, column chromatography and the like.

intermediate A2 is The converted to N-alpha-tbutoxycarbonyl-Ng-nitro-L-argininal **A3** by two step procedure. To a cooled mixture of A2 in solvent, suitably 15 tetrahydrofuran, a mixture of reducing agent, preferably lithium aluminum hydride, in solvent is added. The addition and reaction are preferably conducted at low temperature, preferably below -60°C. After the reaction is complete, the mixture is allowed to warm to about 0°C and 20 completeness of the reaction is confirmed (by, e.g., TLC). The mixture is then cooled again to about -70°C. and a solution of sodium bisulfate is slowly added. The temperature is maintained below -30°C during the addition. the reaction is complete, the reaction mixture is slowly 25 allowed to warm to about 0°C. The product A3 is isolated by conventional procedures such as filtration, concentration under vacuum, washing, extraction, chromatography and the like.

Intermediate A3 is converted to the corresponding Nalpha-t-butoxycarbonyl-Ng-nitro-L-argininal ethyl cyclol A4
by treatment of an ethanolic solution of A3 with
hydrochloric acid. The reaction may be conveniently
carried out at room temperature. The ethylcyclol product
A4 is isolated by conventional procedures such as column
chromatography and evaporation under vacuum.

The ethyl cyclol intermediate A4 is preferably converted to its salt form, suitably its trifluoroacetate

or, more preferably its hydrochloride from A5 by methods such as treatment with trifluoroacetic acid/methylene chloride (for the trifluoroacetate salt) or ethanol saturated with hydrogen chloride (for the hydrochloride salt).

The ethyl cyclol salt A5 is then coupled to Nprotected dipeptide intermediate A6. Preparation suitable dipeptide intermediates and deprotection of the FMOC-protected intermediate A10 to give A6 having a free 10 carboxyl is described and exemplified, by Examples 128 to 136 and 140 to 141. Intermediates A6 and A5 are coupled by adding to a cooled (about 0°C) solution of A6, HBTU and HOBT in solvent, preferably DMF/acetonitrile, A5 and 4-For convenience, the reaction methylmorpholine. The product A7 is isolated 15 conducted at room temperature. conventional procedures such as evaporation under vacuum, washing, extraction, drying, chromatography and the like.

Compound A7 is converted to A8 by catalytic 20 hydrogenation using a suitable hydrogenation catalyst such as palladium on carbon, followed by isolation of the product using conventional procedures such as filtration, vacuum evaporation, lyophilization and the like.

of the argininal cyclol to give the argininal. Preferred means of hydrolyzing include treatment with aqueous acid. Preferred aqueous acids, include hydrochloric acid, HPF6, methanesulfonic acid, perchloric acid, sulfuric acid, trifluoroacetic acid, trifluoromethanesulfonic acid, toluenesulfonic acid and the like. The hydrolysis reaction is quenched by addition of sodium acetate solution; and isolated by conventional procedures, conveniently by reverse phase HPLC.

Other methods for the solution synthesis of peptide aldehydes have been reported. For example, see McConnell et al., supra; at 87 and references therein; Bajusz et al., J. Med. Chem., 33: 1729 (1990); Kawamura et al., Chem.

Pharm. Bull., <u>17</u>: 1902 (1969), and Someno et al., Chem. Pharm. Bull., <u>34</u>:1748 (1986).

According to another aspect, the present invention is to pharmaceutically acceptable salts of the 5 compounds of formula (IA). "Pharmaceutically acceptable salt" includes within its definition salts of the compounds of the present invention derived from the combination of such compounds and an organic or inorganic acid. In practice, the use of the salt form amounts to use of the 10 base form. The compounds of the present invention are useful in both free base and salt form, with both forms being considered as being within the scope of the present These salts include acid addition salts, for invention. example, salts of hydrochloric acid, hydrobromic acid, acetic acid, benzene sulfonic acid and other suitable acid addition salts.

3. Selection of Preferred Compounds

The compounds of the present invention are screened for their ability to inhibit thrombin or factor Xa and Certain of the preferred plasmin as set forth below. compounds are distinguished by their ability to inhibit thrombin, while not substantially inhibiting plasmin. respect to thrombin and plasmin and as used herein, the term "not substantially inhibiting" means that the IC50 (or Ki) for plasmin for a given compound is greater than or equal to its IC50 (or Ki, respectively) for thrombin. Alternatively, certain of the preferred compounds distinguished by their ability to inhibit factor Xa, while not substantially inhibiting plasmin. With respect to factor Xa and plasmin and as used herein, the term "not substantially inhibiting" means that the IC50 (or Ki) for plasmin for a given compound is greater than or equal to its IC50 (or Ki, respectively) for factor Xa.

The compounds of the present invention are dissolved in buffer to give solutions containing concentrations such that assay concentrations range from 0 to 100 micromolar.

In the assays for thrombin and plasmin, a chromogenic synthetic substrate is added to a solution containing test compound and the enzyme of interest and the residual activity catalytic of that enzyme is determined spectrophometrically. Likewise, in the assays for factor Xa and plasmin, a chromogenic synthetic substrate is added to a solution containing test compound and the enzyme of interest and the residual catalytic activity of that enzyme is determined spectrophometrically. The IC50 of a compound of the present invention is determined from the rate of substrate turnover caused by the specific enzyme being IC₅₀ is that concentration of test compound measured. giving 50% inhibition of the rate of substrate turnover. Likewise, the Ki of a compound of the present invention is determined from the rate of substrate turnover caused by the specific enzyme being measured at various concentrations. Ki is that concentration of test compound giving 50% inhibition of the rate of substrate turnover. Example A and B provides an exemplar of the in vitro assays 20 used to select the compounds of the present invention.

Preferred compounds of the present invention have an IC50 (or Ki) of 0.001 to 200 nM in the thrombin assay, and preferably the IC50 (or Ki) for plasmin will not be less than the IC50 (or Ki) for thrombin. More preferred are compounds having an IC50 (or Ki) of 0.001 to 100 nM in the thrombin assay. Especially preferred are compounds having an IC50 (or Ki) of about 0.001 to 20 nM in the thrombin assay and having a quotient of (IC50 for plasmin)/(IC50 for thrombin) [or (Ki for plasmin)/(Ki for thrombin)], of about 2 to 100,000, preferably 10 to 100,000, and more preferably 10 to 100,000.

Alternatively, preferred compounds of the present invention have an IC50 (Ki) of 0.001 to 200 nM in the factor Xa assay, and preferably the IC50 (Ki) for plasmin will not be less than the the IC50 (Ki) for factor Xa. More preferred are compounds having an IC50 (Ki) of 0.001 to 100 nM in the factor Xa assay. Especially preferred are

T

15

20

30

compounds having an IC50 (Ki) of about 0.001 to 20 nM in the factor Xa assay and having a quotient of (IC50 for plasmin)/(IC50 for factor Xa) [or (Ki for plasmin)/(Ki for factor Xa)], of about 2 to 100,000, preferably 10 to 100,000, and more preferably 100 to 100,000.

Pharmaceutical Compositions. 4.

In another aspect, the present invention encompasses pharmaceutical compositions prepared for storage administration which comprise a therapeutically effective amount of a compound of the present invention pharmaceutically acceptable carrier.

The "therapeutically effective amount" of a compound of the present invention will depend on the route of administration, the type of mammal being treated, and the physical characteristics of the specific mammal under These factors and their relationship to consideration. amount are well known to determining this practitioners in the medical arts. This amount and the method of administration can be tailored to achieve optimal efficacy but will depend on such factors as weight, diet, concurrent medication and other factors which as noted those skilled in the medical arts will recognize.

The "therapeutically effective amount" of the compound 25 of the present invention can range broadly depending upon therapeutic indication. and the the desired affects Typically, dosages will be between about 0.01 mg/kg and 100 mg/kg body weight, preferably between about 0.01 and 10 mg/kg, body weight.

"Pharmaceutically acceptable carriers" for therapeutic use are well known in the pharmaceutical art, and are in Remington's Pharmaceutical described, for example, Sciences, Mack Publishing Co. (A.R. Gennaro edit. 1985). For example, sterile saline and phosphate-buffered saline Preservatives, used. physiological pH may be 35 stabilizers, dyes and even flavoring agents may be provided For example, sodium in the pharmaceutical composition.

benzoate, sorbic acid and esters of p-hydroxybenzoic acid may be added as preservatives. <u>Id.</u> at 1449. In addition, antioxidants and suspending agents may be used. <u>Id.</u>

The pharmaceutical compositions of the present invention may be formulated and used as tablets, capsules or elixers for oral administration; suppositories for rectal administration; sterile solutions and suspensions for injectable administration; and the like. The dose and method of administration can be tailored to achieve optimal efficacy but will depend on such factors as weight, diet, concurrent medication and other factors which those skilled in the medical arts will recognize.

When administration is to be parenteral, such as intravenous on a daily basis, injectable pharmaceutcial 15 compositions can be prepared in conventional forms, either as liquid solutions or suspensions, solid forms suitable for solution or suspension in liquid prior to injection, or as emulsions. Suitable excipients are, for example, water, saline, dextrose, mannitol, lactose, lecithin, sodium glutamate, cysteine hydrochloride, or the like. if desired, the injectable pharmaceutical addition, contain minor compositions may amounts of auxilliary substances, such as wetting agents, pH buffering If desired, absorption enhancing agents, and the like. 25 preparations (e.g., liposomes) may be utilized.

5. <u>Utility and Methods</u>.

Compounds of the present invention when made and selected as disclosed are useful as potent inhibitors of thrombin in vitro and in vivo. Alternatively, compounds of the present invention when made and selected as disclosed are useful as potent inhibitors of factor Xa in vitro and in vivo. As such, these compounds are useful as in vitro diagnostic reagents to prevent the clotting of blood and as in vivo pharmaceutical agents to prevent thrombosis in mammals suspected of having a condition characterized by abnormal thrombosis.

The compounds of the present invention are useful as in vitro diagnostic reagents for inhibiting clotting in The use of stoppered test tubes blood drawing tubes. having a vaccum therein as a means to draw blood obtained 5 by venipuncture into the tube is well known in the medical arts. Kasten, B.L., "Specimen Collection", Laboratory Test Handbood, 2nd Edition, Lexi-Comp Inc., Cleveland pp. 16-17 (Edits. Jacobs, D.S. et al. 1990). Such vacuum tubes may be free of clot-inhibiting additives, in which case, they are useful for the isolation of mammalian serum from the They may alternatively contain clot-inhibiting blood. additives (such as heparin salts, EDTA salts, citrate salts or oxalate salts), in which case, they are useful for the The isolation of mammalian plasma from the blood. compounds of the present invention are potent inhibitors of factor Xa or thrombin, and as such, can be incorporated into blood collection tubes to prevent clotting of the mammalian blood drawn into them.

The compounds of the present invention are used alone, in combination of other compounds of the present invention, 20 or in combination with other known inhibitors of clotting, The amount to be added to in the blood collection tubes. such tubes is that amount sufficient to inhibit the formation of a clot when mammalian blood is drawn into the The addition of the compounds to such tubes may be 25 accomplished by methods well known in the art, such as by introduction of a liquid composition thereof, as a solid composition thereof, liquid composition which or The compounds of the present lyophilized to a solid. invention are added to blood collection tubes in such 30 amounts that, when combined with 2 to 10 mL of mammalian such compounds will be concentration of the blood, sufficient to inhibit clot formation. Typically, required concentration will be about 1 to 10,000 nM, with 10 to 1000 nM being preferred. 35

The compounds of the present invention are useful as a pharmaceutical agent for preventing thrombosis in a mammal

suspected of having a condition characterized by abnormal thrombosis.

Conditions characterized by abnormal thrombosis are well known in the medical arts and include those involving the arterial and venous vasculature of mammals. respect to the coronary arterial vasculature, abnormal thrombosis (thrombus formation) characterizes the rupture of an established atherosclerotic plaque which is the major cause of acute myocardial infarction and unstable angina, 10 as well as also characterizing the occlusive coronary thrombus formation resulting from either thrombolytic therapy or percutaneous transluminal coronary angioplasty (PTCA). With respect to the venous vasculature, abnormal thrombosis characterizes the condition observed in patients 15 undergoing major surgery in the lower extremities or the abdominal area who often suffer from thrombus formation in the venous vasculature resulting in reduced blood flow to the affected extremity and a predisposition to pulmonary thrombosis further embolism. Abnormal characterizes disseminated intravascular coagulopathy which commonly 20 occurs within both vascular systems during septic shock, certain viral infections and cancer, a condition wherein there is rapid consumption of coagulation factors and systemic coagulation which results in the formation of thrombi occurring throughout the life-threatening 25 microvasculature leading to widespread organ failure.

The present invention includes methods for preventing a condition in a mammal suspected of having a condition characterized by abnormal thrombosis, comprising administering to said mammal a therapeutically effective amount of a compound or a pharmaceutical composition of the present invention.

The compounds or pharmaceutical compositions of the present invention are administered in vivo, ordinarily in a mammal, preferably in a human. In employing them in vivo, the compounds or pharmaceutical compositions can be administered to a mammal in a variety of ways, including

WO 95/28420 PCT/US95/04954

64

parenterally, intravenously, subcutaneously, intramuscularly, colonically, rectally, nasally or intraperitoneally, employing a variety of dosage forms. Administration is preferably parenteral, such as intravenous on a daily 5 basis.

In practicing the methods of the present invention, the compounds or pharmaceutical compositions of the present invention are administered alone or in combination with one another, or in combination with other therapeutic or in vivo diagnostic agents.

As is apparent to one skilled in the medical art, a therapeutically effective amount of the compounds pharmaceutical compositions of the present invention will vary depending upon the age, weight and mammalian species 15 treated, the particular compounds employed, the particular mode of administration and the desired affects and the therapeutic indication. Because these factors and their relationship to determining this amount are well known in the medical arts, the determination of therapeutically effective dosage levels, the amount necessary to achieve the desired result of preventing thrombosis, will be within the ambit of one skilled in these arts. Typically, administration of the compounds or pharmaceutical composition of the present invention is commenced at lower dosage levels, with dosage levels being increased until the desired effect 25 of preventing in vivo thrombosis is achieved which would define a therapeutically effective amount. compounds of the present invention, alone or as part of a pharmaceutical composition, such doses are between about 0.01 mg/kg and 100 mg/kg body weight, preferably between about 0.01 and 10 mg/kg, body weight.

To assist in understanding, the present invention will now be be further illustrated by the following examples. These examples as they relate to this invention should not, of course, be construed as specifically limiting the invention and such variations of the invention, now known or later developed, which would be within the purview of one

10

20

30

skilled in the art are considered to fall within the scope of the invention as described herein and hereinafter claimed.

5

Examples

Example 1

Preparation of alpha-N-t-butoxycarbonyl-Ng-nitroargininal

10

Procedure 1:

The following procedure for the synthesis of alpha-tbutoxycarbonyl-Ng-nitro-argininal, the title compound, an example of a general procedure for the preparation of Boc-amino acid aldehydes, see Patel et al., Biochim. Biophys. Acta, 748, 321-330 (1983).

In 200 mL dry THF, 12.7 g Boc-N^g-nitro-arginine (40 20 mmoles) and 7.0 g carbonyldiimidazole (CDI; 43 mmoles) were added at room temperature and allowed to stir for 30 The reaction mixture was cooled to -78°C and 35 mL of a solution of LiAlH4 (1M in THF) were added dropwise over thirty minutes. The reaction was allowed to stir for an additional hour at -78°C. Next, 18 mL of acetone were added and this mixture was quickly added to 400 mL of 1N HCl. The mixture was extracted twice with 100 mL of ethyl The ethyl acetate washes were combined and then acetate. washed two times each with 100 mL water, 100 mL saturated NaHCO3 and 100 mL saturated NaCl. The solution was dried (MgSO₄) and concentrated to a foam. The crude weight of the title compound was 6.36 g (21 mmole; yield 52%).

2Ò

30

35

66

В. Procedure 2:

Alternatively, the title compound was synthesized by a modification of the procedure of Fehrentz, J.A. and Castro, B., Synthesis, 676 (1983).

11.4 mL of N-methyl piperidine was slowly added to a stirred suspension of 8.42 g (94 mmole) of N,O-dimethylhydroxylamine hydrochloride in 75 mL dichloromethane which had been cooled to about 0°C. The solution was allowed to stir for 20 minutes which gave the free hydroxylamine, then was kept cold for use in the next step.

In a separate flask, 30.0 g (94 mmole) of Boc-N^gnitroarginine was dissolved by heating in about 1400 mL of THF, then the mixture was cooled under nitrogen to 0°C. 11.4 mL of N-methylpiperidine and 12.14 mL (94 mmole) of isobutylchloroformate was added and the mixture stirred for The free hydroxylamine prepared above was added all at once and the reaction mixture was allowed to warm to room temperature, then stirred overnight.

The resulting precipitate was filtered off, then washed with 200 mL of THF. After concentrating the filtrates to about 150 mL under vacuum, 200 mL of ethyl acetate was added, followed by ice to cool the solution. The cooled ethyl acetate phase was washed with two 75 mL 25 portions of 0.2N hydrochloric acid, two 75 mL portions of 0.5N sodium hydroxide, one portion of 75 mL of brine, then the organic phase was dried over MgSO4. Upon concentration solid Boc-Ng-22.7 g (70% yield) of nitroarginine N-methyl-O-methylcarboxamide was recovered. in 9:1 analysis layer chromatographic Thin dichloromethane/methanol (silica gel) showed one spot.

A flask was placed under a nitrogen atmosphere and cooled to -50°C, then charged with 70 mL (70 mmole) of 1N lithium aluminum hydride (in THF) and 500 mL of dry THF. 50 mL of a solution containing 66 mmole of nitroarginine N-methyl-O-methylcarboxamide in dry THF was slowly added while the temperature of the reaction mixture

was maintained at -50°C. After allowing the reaction mixture to warm to 0°C by removal of the cooling, it was recooled to -30° C, at which temperature, 100 mL (0.2 mole) of 2N potassium bisulfate was added with stirring over 5 about a 10 to 15 minute period. The reaction mixture was then allowed to stir at room temperature for 2 hours. After filtering off the precipitate, the filtrate was concentrated to 100 mL under vacuum. The concentrate was poured into 800 mL ethyl acetate, then was successively 10 washed with two 50 mL portions of 1N hydrochloric acid, two 50 mL portions of saturated sodium bicarbonate, one 50 mL portion of brine. The combined aqueous extracts were extracted with 3-100 mL portions of ethyl acetate. All of the ethyl acetate washes were combined, then was dried over MgSO4. The mixture was concentrated under vacuum to yield 18.5 g (95%) of the title compound.

Example 2

<u>Preparation of trans-4-(aminomethyl)-cyclohexane</u>

<u>carboxylic acid benzyl ester para-touluenesulfonate salt</u>

50 g (0.318 moles) of trans-4-(aminomethyl)25 cyclohexane carboxylic acid, 61.7 g (0.324 moles) ptoluenesulfonic acid, 250 mL (2.4 moles) benzyl alcohol and
250 mL toluene were combined and stirred. The mixture was
refluxed for 24 hours and the liberated water was removed
azeotropically by means of a Dean-Stark apparatus. A clear
30 solution was obtained after 5 hours of refluxing. The
solution was allowed to cool to room temperature. and the

product crystallized. The mixture was vacuum filtered, washed with ether and dried in a vacuum oven to give 128.12 g (96% yield.). Reference: Greenstein, Jesse P.; Winitz, Milton. Chemistry of the Amino Acids. vol. 2, (1986), 942. 5 ¹H NMR (CD₃OD) d 1.05 (m, 2H), 1.43 (m, 2H), 1.59 (m, 1H), 1.85 (m, 2H), 2.03 (m, 2H), 2.33 (m, 1H), 2.35 (s, 3H), 2.75 (d, 2H), 5.09 (s, 2H), 7.23 (d, 2H), 7.32 (m, 5H), 7.69 (d, 2H). <u>Preparation of 1-t-butoxycarbonyl-semicarbazidyl-</u>
<u>trans-4-methyl cyclohexane carboxylic acid benzyl ester</u>

15

3.24 g (0.02 moles) carbonyldiimidazole (CDI) were dissolved in 45 mL of dimethylformamide (DMF) at room temperature under nitrogen. A solution of 2.48 g (0.02 moles) t-butyl carbazate in 45 mL DMF was added dropwise. Next 8.38 g (0.02 moles) of solid benzyl ester of Example 2 20 was added, followed by the dropwise addition of 3.06 mL of triethylamine (TEA) over a 30 minute period. The reaction was allowed to stir at room temperature under nitrogen for Water (100 mL) was added and this mixture was one hour. extracted three times with 50 mL of ethyl acetate. ethyl acetate layers were combined and extracted two times each with 75 mL 1N HCl, H2O, NaHCO3, NaCl and dried with The mixture was filtered and the solution was MgSO₄. concentrated to give an oil. This material could be

purified by recrystallization from ethyl acetate/hexanes (M.P. = $106-108^{\circ}$ C) or used directly in the next step. ¹H NMR (CDCl₃) d 0.94 (m, 2H), 1.42 (m, 2H), 1.45 (s, 9H), 1.81 (m, 2H), 2.02 (m, 2H), 2.27 (m, 1H), 3.17 (t, 2H), 5.09 (s, 2H), 5.51 (t, 1H), 6.46 (s, 2H), 7.34 (m, 4H).

Example 4

<u>Preparation of 1-(t-butoxycarbonyl)-3-semicarbazidyl-trans-4-methyl-cyclohexane carboxylic acid</u>

To the crude Boc-benzyl ester of Example 3, 250 mL of methanol (MeOH) and 500 mg of 10% palladium on carbon were added. After shaking on the hydrogenator for one hour at 5 psi, the mixture was filtered with Celite through a fine fritted filter. The solution was concentrated to a foam, dichloromethane was added and a precipitate formed. The mixture was kept 5°C for 65 hours. The crystallized material was filtered with ether and 4.0 g of crude product were obtained (12.7 mmoles; yield 62% overall yield from the compound of Example 2) ¹H NMR (CD₃OD), d 0.96, (m, 2H), 1.42 (m, 2H), 1.46 (s, 9H), 1.82 (m, 2H), 1.97 (m, 2H), 2.18 (m, 1H), 3.0 (t, 2H). M.P. = 185-189°C.

70

Example 5

Preparation of semicarbazidyl-trans-4-methyl cyclohexane carboxylic acid trifluoroacetate salt

315 mg (1 mmole) of compound of Example 4 was added to 10 mL of trifluoroacetic acid (TFA) at 0°C and the resulting solution was allowed to stir for 30 minutes.

10 After this time the solution was added dropwise to 75 mL of diethyl ether. A precipitate formed, and the mixture was filtered and washed with diethyl ether. Weight of crude product was 254 mg, 0.77 mmoles; yield (77%). ¹H NMR (CD₃OD), d 1.0 (m, 2H), 1.38 (m, 2H), 1.43 (m, 1H), 1.84

15 (m, 2H), 2.01 (m, 2H), 2.22 (m, 1H), 3.04 (d, 2H). M.P. = 154-156°C.

Example 6

Preparation of alpha-(t-butoxycarbonyl)-Ng-nitro argininal20 semicarbazonyl-trans-4-methyl-cyclohexane carboxylic acid

A solution of 13.7 g (41.6 mmoles) of the compound of Example 5, 18.0 g (~59 mmoles) of crude compound of Example 1 in 135 mL ethanol containing 45 mL of water, was treated

with 9.41 g (69 mmoles) of sodium acetate (NaOAc) and refluxed for one hour. This solution was allowed to cool and then poured into 0.1N HCl and extracted three times with ethyl acetate. The combined organic phase was washed with water, then brine, dried (MgSO₄) and concentrated to a small volume. This cloudy mixture was allowed to set overnight at 5°C to precipitate the product, which was isolated by filtration and dried under vacuum. This gave 9.9 g, 47% yield based on the amount of the compound of Example 5 used. ¹H NMR (CD₃OD) d 1.0 (m, 2H), 1.43 (s, 9H), 1.45-2.20 (m, 13H), 3.09 (d, 2H), 3.30 (m, 2H), 4.18 (bs, 1H), 7.10 (d, 1H). M.P. = 162-163°C.

Example 7

15 Synthesis of Semicarbazone Solid Phase

The title resin, a solid phase reagent, was prepared 20 by coupling of the compound of Example 6 to methylbenzhydralamine (MBHA) resin as follows.

MBHA resin (0.8 g, 0.5 mmoles amino groups) was placed in a reaction vessel and washed successively one time with DCM, three times with DMF, two times with 10% DIEA/DMF, and four times with DMF. Each wash is done by adding 10 mL of solvent to the resin, agitating the mixture for 1-2 minutes, and then draining the solvent.

The washed MBHA resin was placed in a reaction vessel and 5 mL of DMF was added. To this mixture, NMM (0.102 mL, 1 mmole), BOP (443 mg, 1 mmole) and the compound of Example 6 (500 mg, 1 mmole) was added. The mixture was then mixed

on a rotating wheel for 16 hours. After this time, the resin was filtered off and washed successively three times with DMF, two times with 10% DIEA/DMF and three times with DMF. The resin was then washed successively one time with 5 DCM, one time with methanol and one time with diethyl ether to yield the title resin. Each wash was again done by adding 10 mL of solvent to the resin, agitating the mixture for 1-2 minutes, and then draining the solvent.

The title resin showed a 98-99% coupling yield by 10 ninhydrin. The yield was calculated on the basis of the mmoles/g of amino groups on the starting MBHA resin.

Example 8

Solid Phase Synthesis

The compounds of the present invention may be made by the solid-phase synthesis method as described in this example. This synthesis method is carried out in three stages - coupling, cleavage and hydrolysis.

Washing of the resin is common step in this procedure. Accordingly, unless otherwise specified, a wash is defined as the adding 5-10 mL of a specified solvent to the resin, agitating the mixture for 1-2 minutes, and then draining the solvent away from the resin.

A. Coupling.

20

In the first stage of the present method, specified intermediates are coupled to the resin of Example 7 in the following manner:

- 1. The resin of Example 7 (0.5 g, 0.25 mmole alphaamino groups) is placed in a reaction vessel and washed three times with DCM.
- 2. The alpha-amino groups of the resin are deprotected by twice immersing the resin in 5-10 mL of 50% 35 TFA in DCM, with first time for 5 minutes and the second time for 30 minutes. The resin is then washed two times with DMF, two times with DCM, and two times with DMF.

- 3. The deprotected resin is neutralized by immersing the resin in 5-10 mL of 5% DIEA in DMF for 7 minutes. The resin is then washed two times with DMF, two times with DCM, and two times with DMF.
- 5 4. The deprotected resin is combined with 5 mL of DMF and then 1.0 mmole of amino acid, amino acid analog, peptide or peptide analog (which has a free C-terminal carboxy group, is protected by a Boc group or otherwise blocked at the N-terminal amino group, and suitably 10 protected at all other reactive functionalities), TBTU (0.321 mg, 1.0 mmole), HOBt (0.135 mg, 1.0 mmole), NMM (0.11 mL, 1.0 mmole) and 3 mL of DMF, then the mixture is agitated for three hours. BOP (0.442 mg, 1.0 mmole) may be substituted for the TBTU.
- 5. If further amino acids, amino acid analogs, peptides or peptide analogs are to be sequentially coupled, steps 2-4 is repeated until the desired compound is achieved.
- 6. The resin is separated from the DMF solution and is washed three times with DMF, three times with DCM, three times with methanol, and three times with diethyl ether. The resin is then dried under vacuum.

B. Cleavage.

In the second stage of the present method, the desired compound in the form of a semicarbazone intermediate is cleaved from the resin.

The dried resin (0.50 g) from Step A is placed in a reaction vessel and anisole (0.5 mL) is added. Thiocresol (0.1 mL) is additionally added for the cleavage of certain specified compounds of the present invention. After cooling the reaction vessel to -20°C, gaseous hydrofluoric acid (12.0 mL) is distilled into the reaction mixture with stirring.

After stirring for 30 minutes at -20°C, the reaction mixture is warmed to -10°C and stirred for an additional 2 hours at this temperature. After this time, the reaction

25

74

mixture is warmed to 0°C and the hydrofluoric acid is distilled off with a stream of N2. The resin is then washed twice with diethyl ether.

The title compound is extracted from the resin by 5 successively washing the resin with 0.1M bicarbonate (50 mL) and water (100 mL), which are then combined and extracted three times with diethyl ether using 25 mL of the solvent for each extraction. The extracted aqueous solution is frozen and lyophilized to give the 10 crude semicarbazone of title product.

C. Hydrolysis.

the third stage of the present method, semicarbazone intermediate is hydrolyzed to the compound of the present invention.

Crude semicarbazone (0.25 mmole) from Step B is placed in a reaction vessel, followed by 6 mL acetic acid, 12 mL THE and 6 mLof water (adjusted to Hq trifluoroacetic acid). Stirring is commenced and 1 mL of 20 ethyl acetoacetate is added. Additional 1 mL portions of ethyl acetoacetate are added every 1-8 hours until the semicarbazone is hydrolyzed to the title compound. reaction mixture is then reduced to dryness under vaccum to give crude title compound.

The crude title compound is purified by high pressure chromatography, using a reverse-phase column containing a C-18 resin comprised of 10 micron-size gel particles with a 300 angstrom pore size. The column is eluted with a water-acetonitrile (both containing 0.1% 30 trifluoroacetic acid) gradient, where the gradient is run from 5% to 40% acetonitrile. The column fractions are analyzed by analytical high pressure liquid chromatography using a reverse phase C-18 column and the same gradient system. The fractions containing pure product are pooled, 35 then lyophilized to yield the title product.

75

Example 9

5

Preparation of L-methionine sulfone-L-proline-O-benzylester hydrochloride salt

A. <u>Procedure 1:</u>

N-Boc-L-methionine sulfone-L-proline-O-benzyl ester prepared by adding to a solution of N-Boc-Lmethioninesulfone (14.0 g, 50.0 mmole) in dichloromethane (150 mL) at 0°C, HOBt (10.1 g, 75 mmole) followed by DCC (11.33 g, 55.0 mmole). The mixture was stirred for 10 minutes, and then proline benzyl ester hydrochloride salt (50.0 mmole, 12.0 g) was added followed by NMM (100 mmole, The resulting mixture was stirred in an ice bath and allowed to come to room temperature over 12 The hours. mixture was filtered to remove dicyclohexylurea and ethyl acetate (300 mL) is added. The organic phase was then added to a separatory funnel and 20 washed with saturated aqueous sodium bicarbonate, brine and then 1M aqueous HCl. The organic phase was dried over magnesium sulfate and then filtered. The organic phase was then reduced on a rotary evaporator under vacuum and then on a high vacuum line to remove traces of solvent to 25 provide 23.5 g of a white solid (100%). Rf=0.34 (silica, 5:95 methanol/chloroform).

To a solution of N-Boc-L-methionine sulfone-L-proline-O-benzyl ester (23.5 g, 50 mmole) in dry dioxane (300 mL) was added 100 mL of a 4M HCl/dioxane solution. The mixture was then stirred at room temperature for 1 hour until the starting material disappeared as shown by thin layer chromatography analysis (silica, 10% chloroform in methanol). Diethyl ether was added to the mixture to

precipitate the title compound as a white hydrochloride salt. The mixture was filtered on a Büchner funnel and the solid was then dried under high vacuum to give 20.16 g (100%) of the title compound as a white solid.

5

B. Procedure 2:

Alternatively, the title compound was synthesized by the following method.

To a solution of N-Boc-L-methionine sulfone (5 g, 20 mmole) in 80 mL of dry DMF was added L-proline-O-benzyl ester hydrochloride salt (4.8 g, 20 mmole) followed by BOP (8.9 g, 20 mmole) and NMM (5.5 mL, 20 mmole). The mixture was stirred for 16 hours at room temperature. The reaction mixture was dissolved in 600 mL of ethyl acetate and washed with 200 mL each of water, 1M aqueous HCl, water, saturated aqueous sodium bicarbonate and brine. The organic phase was dried over magnesium sulfate, filtered and the solvent removed under vacuum to yield an oil.

20 To the solution of the resulting oil in 20 mL dichloromethane, 100 mL of a 4M solution of HCl in dioxane was added. After stirring for 16 hours, the solvent was removed under vacuum. The resulting oil was precipitated using diethyl ether, filtered and dried under vacuum to 25 provide 7.49 g (86% yield) of the title compound as a white solid. Thin layer chromatography analysis of the title compound showed a single spot with Rf = 0.1 (silica, 1:9 methanol/dichloromethane).

77

Example 10

<u>Preparation of N-(1-butanesulfonyl)-L-methioninesulfone-L-proline</u>

A 6.0 g (12.4 mmole) of the compound of Example 9 was reacted with 2.07 mL (16 mmole) of 1-butane-sulfonylchloride and 5.0 mL (36 mmole) of triethylamine in dichloromethane from 0°C to room temperature. The reaction mixture was poured into saturated aqueous bicarbonate and extracted with ethyl acetate (2 x 100 mL). The organic phase was washed with brine and 1M aqueous HCl. The organic phase was separated and dried over 15 magnesium sulfate, filtered and reduced under vacuum to give 5.73 g of a viscous oil.

The oil was mixed with 2 M potassium hydroxide (20 mL) and 100 mL methanol at room temperature for two hours. The methanol was reduced under vacuum and the aqueous solution was then washed with ether (2 x 50 mL) and then neutralized with 1M HCl to a pH of 1. The aqueous solution was then extracted with ethyl acetate (2 x 100 mL) and dried over MgSO4, filtered and reduced under vacuum to give 2.85 g of the the title compound as a viscous foamy solid. The overall yield was 60.5%.

Example 11

<u>Preparation of N-(1-butanesulfonyl)-L-methioninesulfone-L-proline-L-argininal</u>

The title compound was prepared in the same manner as described in Example 8.

The compound of Example 10 was attached to the resin of Example 7. After cleavage of the title compound as a protected semicarbazone from the resin, the semicarbazone was hydrolyzed to give the title compound.

Fast atom bombardment mass spectrometry confirmed the theoretical molecular weight of 538.2.

15

5

10

Example 12

Preparation of cyclohexylmethylsulfonate sodium salt

20

To a solution of sodium bisulfite (32 g, 307 mmole) in H2O (200 mL) was added cyclohexylmethyl bromide (21 mL, 150 mmole). The mixture was then stirred vigorously while heated at reflux for 48 hours. Upon cooling to room temperature, a white precipitate formed. The precipitate was collected on a Büchner funnel and washed with diethyl ether to wash away residual cyclohexylmethyl bromide. The white plate-like solid was dried under high vacuum overnight to provide 11.8 g (39%) of the title compound which

WO 95/28420

5

79

had a m.p. >400°C.

Example 13

Preparation of cyclohexylmethyl sulfonyl chloride

To the compound of Example 12 (4.0 g, 20 mmole) was added POCl₃ (15 mL) and the mixture heated at 100°C for 48 10 hours. Upon cooling to room temperature the mixture was poured onto crushed ice and then the aqueous phase was extracted with ethyl acetate (2x100 mL). The combined organic extracts were then washed with saturated aqueous sodium bicarbonate (2x50 mL), brine and then dried over 15 MgSO₄, filtered and the solvent was evaporated under vacuum to provide 3.46 g of the title compound as a light yellow oil. Thin layer chromatography analysis of the title compound showed a single spot with R_f = 0.53 (silica, 4:1 hexanes/ethyl acetate).

20

Example 14

Preparation of N-Boc-L-methionine sulfone-O-benzyl ester

25

To a solution of N-Boc-L-methionine sulfone (50 g, 178 mmole) in dry THF (500 mL) which had been chilled to O°C, carbonyl diimidazole (34.6 g, 214 mmole) was added in small portions. After 30 minutes, the mixture was warmed to room temperature for 2 hours until all of the CO2 evolution ceased. After this time, benzyl alcohol (27.6

mL, 267 mmole) was added and the reaction stirred for 12 hours.

The reaction mixture was then reduced in volume under vacuum and the resulting residue was diluted with ethyl acetate (500 mL). The organic phase was then washed with saturated bicarbonate (1x100 mL), brine (100 mL), then saturated aqueous citric acid (1x100 mL), dried over MgSO4, filtered and the solvent removed under vacuum to provide a white solid. The white solid was washed with a 1:1 mixture of diethyl ether/hexanes (300 mL) and filtered off on a Büchner funnel to provide 50.0g (92%) of the title compound. Thin layer chromatography analysis of the title compound showed a single spot with Rf=0.18 (silica, 3:2 hexanes/ethyl acetate).

15

Example 15

Preparation of L-methionine sulfone-O-benzyl ester hydrochloride salt

20

To the compound of Example 14 (50.0g), 200 mL of a 4M solution of HCl in dioxine was added. The solid eventually dissolved over 2 hours and showed no starting material by thin layer chromatography. The solution was then reduced in volume under vacuum and the resulting solid was washed with diethyl ether to provide 55.0 g (100%) of the title compound as a white solid.

81

Example 16

<u>Preparation of N-cyclohexylmethanesulfonyl-L-methionine</u> <u>sulfone-O-benzyl ester</u>

To a suspension of the compound of Example 15 (4.6 g, 15 mmole) in dry CH₃CN (35 mL) cooled to 0°C in an ice bath, the compound of Example 13 (N-cyclohexylmethane sulfonyl chloride, 3.46 g, 17.6 mmole) as a solution in CH₃CN (10 mL) was added, followed by pyridine (3.8 mL, 45 mmole). The reaction was allowed to stir in the ice bath for 15 hours while slowly warming to room temperature. The solvent was evaporated under vacuum to give a residue.

The resulting residue was dissolved in ethyl acetate (200 mL) and the solution was washed with saturated aqueous bicarbonate (50 mL), brine (50 mL), saturated aqueous citric acid (50 mL), and dried over MgSO4. The solution was filtered and evaporated under vacuum to provide 3.3 g of a yellow oil. This crude product was purified by silica gel flash chromatography to provide 1.63 g (25%) of the title compound as a clear viscous oil. Thin layer chromatography analysis of the title compound showed a single spot with Rf=0.29 (silica, 3:2 ethyl

25 acetate/hexanes).

Example 17

<u>Preparation of N-cyclohexylmethanesulfonyl-L-methionine</u> sulfone

To a solution of the compound of Example 16 (1.6 g, 3.7 mmole) in CH3OH (50 mL), 250 mg 10% palladium on carbon was added. This mixture was then subjected to atmospheric hydrogenation at room temperature for 12 hours. The reaction mixture was then filtered through a pad of celite and the solvent was evaporated under vacuum to provide the title compound (1.06g, 88%) as a white solid. Thin layer chromatography analysis of the title compound showed a single spot with Rf=0.2 (silica, 9:1 chloroform/methanol).

Example 18

20 <u>Preparation of N-cyclohexylmethanesulfonyl-L-methionine</u> sulfone-L-proline-L-argininal

The title compound was prepared in the same manner as described in Example 8.

N-Boc-L-proline was first attached to the resin of Example 7, followed by the compound of Example 17. title compound as cleavage of the semicarbazone from the resin, the semicarbazone was hydrolyzed to give the title compound.

Fast atom bombardment mass spectrometry confirmed the theoretical molecular weight of 578.2.

Example 19

10 Preparation of N-(1-naphthylenesulfonyl)-L-methionine sulfone-L-proline-O-benzyl ester

To a solution of the compound of Example 9 (3 g, 6.9 15 mmole) in 70 mL of dry acetonitrile, 1-naphthylenesulfonyl chloride (2.3 g, 10.3 mmole) was added followed by dry pyridine (4.1 mL, 34.4 mmole). After stirring for 16 hours at room temperature, the solvent was removed under 20 vacuum and the resulting oil was dissolved in 500 mL ethyl acetate and washed with 100 mL each of water, 1M aqueous HCl, water, saturated aqueous sodium bicarbonate The organic phase was dried over MgSO4, filtered and the solvent removed under vacuum to yield an oil.

The oil was filtered down a pad of silica (50 g), rinsing with two 500 mL portions of dichloromethane followed by three 500 mL portions of 1:9 methanol/ dichloromethane. The appropriate fractions were concentrated under vacuum to provide 3.8 g (99% yield) of the 30 title compound. Thin layer chromatography analysis of the title compound showed a single spot with Rf = 0.5 (silica, 1:9 methanol/dichloromethane).

25

Example 20

<u>Preparation of N-(1-naphthylenesulfonyl)-L-methionine</u> <u>sulfone-L-proline</u>

To a solution of the compound of Example 19 (3.8 g, 6.8 mmole) in 10 mL of THF and 250 mL of methanol under a nitrogen blanket, 10% palladium on carbon (2 g) was added.

10 This mixture was hydrogenated at 1 atmosphere for 16 hours. The mixture was then filtered and concentrated under vacuum to provide 3 g (96% yield) of the title compound as a white solid. Thin layer chromatography analysis of the title compound showed a single spot with 15 Rf = 0.2 (1:9 methanol/dichloromethane).

Example 21

<u>Preparation of N-(1-naphthylenesulfonyl)-L-methionine</u> <u>sulfone-L-proline-L-argininal</u>

20

The title compound was prepared in the same manner as described in Example 8.

25 The compound of Example 20 was attached to the resin

of Example 7. After cleavage of the title compound as a protected semicarbazone from the resin, the semicarbazone was hydrolyzed to give the title compound.

Fast atom bombardment mass spectrometry confirmed the theoretical molecular weight of 608.2.

Example 22

<u>Preparation of N-(2-naphthylenesulfonyl)-L-methionine</u> sulfone-L-proline-O-benzyl ester

10

A 3 g (6.878 mmole) portion of the compound of Example 9 was added to 69 mL of acetonitrile. To this mmole, 1.5 eq.) of (10.3 15 mixture, 2.34 g naphthylenesulfonylchloride and 4.20 g (4.12 mL, 34.4 mmole, 5 eq.) of pyridine was added and the mixture was The mixture was then concentrated stirred for 10 hours. under vacuum, diluted with ethyl acetate (500 mL) and 20 washed with 1M HCl, water, aqueous sodium bicarbonate, and The organic phase was dried over MgSO4 and brine. Thin layer chromatography concentrated under vacuum. (silica, 10% methanol in dichloromethane) showed some 2naphthylsulfonylchloride. The mixture was then filtered 25 down a plug of silica, eluting with dichloromethane (100 mL), then 10% methanol/dichloromethane (200 mL). of the solvent under vacuum from the collected fractions gave 3.96 g of the title compound.

Example 23

5

Preparation of N-(2-naphthylenesulfonyl)-L-methionine sulfone-L-proline

A 3.96 g (7.088 mmole) portion of the compound of Example 22 was dissolved in 250 mL of methanol with a trace of THF. To this solution, 2 g of 10% palladium on 10 carbon was added under a nitrogen blanket. The mixture was then stirred under hydrogen at one atmosphere of pressure for 10 hours. After this time, thin layer chromatography (silica, 10% methanol in dichloromethane) showed no starting material. This solution was then 15 filtered through a nylon filter and concentrated under vacuum to give 3.2 g (96%) of the title compound.

Example 24

Preparation of N-(2-naphthylenesulfonyl)-L-methionine

20 sulfone-L-proline-L-argininal

The title compound was prepared in the same manner as described in Example 8.

The compound of Example 23 was attached to the resin of Example 7. After cleavage of the title compound as a protected semicarbazone from the resin, the semicarbazone was hydrolyzed to give the title compound.

Fast atom bombardment mass spectrometry confirmed the theoretical molecular weight of 608.2.

Example 25

Preparation of N-benzylsulfonyl-L-methionine sulfone-LO proline-O-benzyl ester

To a solution of the compound of Example 9 (20.0 mmole, 8.08 g) in dry acetonitrile (100 mL) cooled to 0°C, alpha-toluenesulfonylchloride (20.0 mmole, 3.8 g) was added all at once followed by pyridine (50.0 mmole, 4.2 mL). The mixture was then stirred in the ice bath for 12 hours eventually warming to room temperature.

The reaction mixture was reduced to a residue under The residue was taken up ethyl acetate (300 mL) and washed with saturated aqueous sodium bicarbonate, brine, 1M aqueous HCl (100 mL), dried over MgSO4, filtered and evaporated under vacuum to provide 8.8 g (100%) of the title compound as a foamy golden solid. Thin layer chromatography analysis of the title compound showed a 95:5 Rf=0.31(silica gel, single spot with chloroform/methanol). The solid was filtered through a plug of silica gel (50 g) using ethyl acetate as eluent before hydrogenation to eliminate possible sulfur related impurities.

20

Example 26

<u>Preparation of N-benzylsulfonyl-L-methionine sulfone-L-proline</u>

To a solution of the compound of Example 25 (8.8 g, 20 mmole) in methanol (300 mL), 1.0 g of 10% palladium on carbon was added. The mixture was then hydrogenated at 1 atmosphere of hydrogen gas and room temperature for 12 hours with stirring. The mixture was then filtered and the organic phase reduced under vacuum to provide 8.0 g (100%) of the title compound as a white foamy solid.

15 Example 27

Preparation of N-benzylsulfonyl-L-methionine sulfone-L-proline-L-argininal

20

The title compound was prepared in the same manner as described in Example 8.

The compound of Example 26 was attached to the resin of Example 7. After cleavage of the title compound as a protected semicarbazone from the resin, the semicarbazone

was hydrolyzed to give the title compound.

Fast atom bombardment mass spectrometry confirmed the theoretical molecular weight of 572.2.

5 Example 28

Preparation of N-Boc-Ng-nitro-argininol.

To a suspension of Boc-Ng-nitro-arginine (370 g, 1.15 moles) in 6 liters of dry THF at -78°C, borane THF complex 1.0 M (2.6 liters) was slowly added. The reaction temperature was controlled so that it did not exceed -60°C. After the addition was complete, the reaction was placed in a freezer at -20°C overnight.

The following day, the greenish-yellow reaction mixture was cooled to -78°C and slowly quenched with 3 liters of anhydrous methanol. Two hours after this quenching, the mixture was warmed to 25°C and stirred for an additional 2 hours. The solvent is removed under vacuum to yield the title compound (360 g). This intermediate is used as is in coupling reactions and the major product had a Rf = 0.28 (silica, 90:10 dichloromethane/methanol) by thin layer chromatography.

20

90

Example 29

<u>Preparation of N-(2-propylpentanovl)-L-methionine sulfone-</u> L-proline-O-benzyl ester

To a solution at 15°C containing the compound of Example 9 (88.06 g, 0.178 mole), 2-propylpentanoic acid (33.45 mL, 0.2136 mole), BOP (94.5 g, 0.2136 mole) and 600 mL of dry DMF, NMM (117 mL, 1.068 mole) was slowly added. The reaction mixture was warmed slowly to 25°C and then was stirred overnight.

On the following day, 1 liter of water was added to the reaction mixture and it was extracted 3 times with 500 mL of ethyl acetate. The organic extracts were combined and washed with 3-300 mL portions of 1.0 N HCl, 3-300 mL portions of saturated sodium bicarbonate and 1-100 mL portion of brine. The organic phase was then dried over magnesium sulfate, filtered, and then the solvent was removed under vacuum to yield 84.6 g (96 %) of the title compound. Thin layer chromatography analysis of the title compound showed a single spot with Rf = 0.35 (silica gel, 95:5 dichloromethane/methanol).

Example 30

Preparation of N-(2-propylpentanoyl)-L-methionine sulfone-L-proline

To a solution of the compound of Example 29 (37 g, 0.07495 mole) and 500 mL methanol, 3.7 g 10 % palladium on carbon wet with dichloromethane was added. The mixture was hydrogenated in a Parr Hydrogenator at 25 psi for 7 hours, after which time the mixture was filtered and the solvent removed under vacuum to yield 29.71 g (98 %) of the title compound as a white solid. Thin layer chromatography analysis of the title compound showed a single spot with Rf = 0.15 (silica, 85:15 dichloromethane/methanol).

Example 31

<u>Preparation of N-(2-propylpentanoyl)-L-methionine sulfone-L-proline-Ng-nitro-L-argininol</u>

20

5

To a solution of compound of Example 28 (34 g, 0.1117 mole) in 500 mL of methanol at 0°C, 1.2 liters of saturated HCl/methanol solution was added. After 30

92

minutes, the ice bath was removed and the reaction mixture was allowed to stir for 2 hours. After this time, the solvent was removed under vacuum and the resulting solid was used as is without furthur purification.

The resulting solid was dissolved in 1 liter of acetonitrile. To this solution, the compound of Example 30 (49.56 g, 0.1225 mole) and BOP (59.11 g, 0.1337 mole) was added, followed by the slow addition of NMM (73.5 mL, 0.668 mole). The mixture was stirred overnight at room After this time, the solvent was removed 10 temperature. under vacuum and the residue was chromatographed on silica eluting with 100:0 90:10 a to gradient g of the title dichloromethane and methanol. 40.5 compound as a white solid was isolated by evaporation of solvents from the collected fractions. Thin 15 chromatography analysis of the title compound showed a spot with Rf = 0.38 (silica gel, 95:5 dichloromethane/methanol).

20 Example 32

Preparation of N-(2-propylpentanoyl)-L-methionine sulfone-L-proline-L-argininol

25

30

To a solution of the compound of Example 31 (6 g, 0.0101 mole), 3 mL of acetic acid and 100 mL methanol, 0.6 g 10 % palladium on carbon wet with dichloromethane was This mixture was hydrogenated added. Hydrogenator at 45 psi for 16 hours. After this time, the

mixture was filtered and the organic phase was removed under vacuum to yield 4.7 g (77%) of the title compound as a glass. Thin layer chromatography analysis of the title compound showed a single spot with Rf = 0.17 (silica gel, 85:15 dichloromethane/methanol).

Example 33

Preparation of N-(2-propylpentanovl)-L-methionine sulfone-L-proline-L-argininal

To a solution of the compound of Example 32 (5.4 g, 9.9 mmole), dichloroacetic acid (4.07 mL, 49.5 mmole), 75

mL of dimethyl sulfoxide and 75 mL of toluene at 0°C, EDC (18.93 g, 99 mmole) was added slowly. The ice bath was removed after 5 minutes and the reaction was allowed to warm to room temperature for 1.5 hours. After this time, the toluene was removed under vacuum and the resulting solution was diluted with 750 mL of HPLC-grade water and filtered. This solution was then chromatographed using a C-18 reverse phase column using a 30 minute gradient comprising 100:0 to 60:40 of HPLC-grade water/acetontrile containing 0.1% trifluoroacetic acid. The fractions were combined and lyophilyzed to give 4.47 g (83.5%) of the title compound.

Fast atom bombardment mass spectrometry confirmed the theoretical molecular weight of 544.3.

Example 34

Preparation of S-methyl-L-cysteine

5

1.49 liter aqueous solution of commercially available (Aldrich) L-cysteine hydrochloride monohydrate (50.0 g, 284.5 mmole) and barium hydroxide octahydrate (94.24 g, 298.7 mmole), at room temperature, was treated with dimethyl sulfate (37.32 g, 295.9 mmole) added dropwise over 40 minutes. After stirring an additional 2 hours, concentrated sulfuric acid (29.27 g, 298.7 mmole) dissolved in 100 mL of de-ionized water was added in The slurry was filtered and the filtrate 15 concentrated to 70 mL under vacuum at 40°c. The solution was adjusted to pH 5-6 (pH papers) with concentrated ammonium hydroxide causing a precipitate to form. slurry (140 mL aqueous volume) was diluted with 240 mL of ethanol, stirred and cooled at 3°c. The white solid was 20 filtered, washed with cold 2:1 ethanol/water (50 mL) and dried under high vacuum at room temperature to give 33.3 g (86.6% yield) of the title compound.

Example 35

25 Preparation of N-Boc-S-methyl-L-cysteine

The compound of Example 34 (15.0 g, 110 mmole) was 30 suspended in 130 mL of saturated sodium bicarbonate (approximately 1.1 M). A solution of di-t-butyl

dicarbonate (26.4 g, 121 mmole) in 60 mL of THF was added and vigorously stirred for 18 hours at room temperature.

The reaction mixture was extracted with diethyl ether (100 mL). The resulting aqueous phase was layered with the ethyl acetate (200 mL) and acidified to pH 2 (pH papers) with 1N hydrochloric. The aqueous layer was further extracted with ethyl acetate (3 x 200 mL). The organic extracts were combined, washed with brine, dried with MgSO4 and the solvent evaporated under vacuum to yield 21.2 mg of the title compound as a clear oil (81.9% crude yield). Thin layer chromatography analysis of the title compound showed a single spot with Rf = 0.5 (silica; 90:10:2 dichloromethane/methanol/acetic acid).

15 Example 36 Preparation of N-Boc-S-methyl-L-cysteine-L-proline-O-

20

The compound of Example 35 (14.64 g, 62.2 mmole) and L-proline-O-benzyl ester hydrochloride (15.04 g, 62.2 mmole) were suspended in 135 mL of acetonitrile at 0°c, then BOP (27.51 g, 62.2 mmole) and NMM (18.9 g, 186.6 mmole) were added. The ice bath was removed after 30 minutes and the reaction was stirred for 18 hours at room temperature.

The reaction mixture solvent was evaporated at 25°c under vacuum to give an oil which was dissolved in ethyl acetate (250 mL). This solution was successively washed with 1N hydrochloric acid (1 x 50 mL), saturated sodium bicarbonate (1 x 50 mL) and brine (1 x 50 mL), dried with MgSO4. The solution was evaporated under vacuum to give crude product.

product was purified by column The crude gel, silica eluting with chromatography on hexane/ethyl acetate. 21.9 g (83.3% yield) of the title compound was isolated as an amorphous solid by evaporating 5 the solvent under vacuum from the column fractions. layer chromatography analysis of the title compound showed with Rf = 0.53(silica, a single spot acetate/hexane).

10 Example 37

Preparation of N-Boc-S-methyl-L-cysteine sulfone-Lproline-O-benzyl ester

15

30

The compound of Example 36 (16.13 g, 38.18 mmole) was dissolved in 200 mL of glacial acetic acid and sodium perborate tetrahydrate (29.37 g, 190.9 mmole) was added and the mixture heated to 55°C. After 2.5 hours at this 20 temperature, the reaction solution was diluted with 800 mL of brine, the aqueous layer was extracted with ethyl acetate (3 x 250 mL) and the combined organic extracts This solution was filtered, were dried with MgSO4. evaporated under vacuum to yield a residue that was repeatedly azeotroped with toluene (200 mL) under vacuum to remove acetic acid. The residual slurry was suspended in ethyl acetate (200 mL), filtered and the solvent evaporated under vacuum to yield 17.4 g (100% yield) of the title compound as a white solid. Thin chromatography analysis of the title compound showed a single spot with Rf = 0.25 (3:2 ethyl acetate/hexane).

97

Example 38

three times.

<u>Preparation of N-(1-butanesulfonyl)-S-methyl-L-cysteine</u> <u>sulfone-L-proline-O-benzyl ester</u>

The compound of Example 37 (2.0 g, 4.4 mmole) was dissolved in 12 mL of 4N anhydrous hydrochloric acid/dioxane and was stirred for several hours at room temperature until all starting material was consumed. The hydrochloric acid/dioxane solution was then evaporated under vacuum to yield an oil. This oil was dissolved in acetonitrile and evaporated under vacuum. This was done

The oil was suspended in 17 mL of acetonitrile, cooled to ice bath temperature, then 1-butanesulfonyl chloride (0.69 g, 4.4 mmole) and pyridine (1.04 g, 13.2 mmole) were added. The reaction was taken from the ice bath after 30 minutes and stirred at room temperature for 18 hours. The reaction mixture was evaporated under vacuum to give an oil. The oil was taken up in 200 mL ethyl acetate, and was washed successively with 1N hydrochloric acid (1 x 50 mL) saturated sodium bicarbonate 1 x 50 mL) and brine (1 x 50 mL). After drying with MgSO4, the solvent was evaporated under vacuum to give crude product.

This crude product was purified by column chromatography silica gel eluting with 1:99; methanol/dichloromethane). Removal of the solvent from the column fractions yielded 1.25 g (59.8% yield) of the title compound as a solid. Thin layer chromatography analysis of the title compound showed a single spot with Rf = 0.59 (silica; 95:5 dichloromethane/methanol).

98

Example 39

<u>Preparation of N-(1-butanesulfonyl)-S-methyl-L-cysteine</u> sulfone-L-proline

The compound of Example 38 (1.55 g, 2.45 mmole) was dissolved in THF (50 mL), 0.5 g of 10% palladium on carbon was added and the mixture was stirred under hydrogen gas at atmospheric pressure for 18 hours.

After the catalyst was filtered off the reaction mixture, the solvent was removed under vacuum and the resulting oil was taken up in a solution of saturated sodium bicarbonate. This solution was then extracted with ethyl acetate (1 x 150 mL) and the organic layer was decanted off. The remaining aqueous layer was layered with 100 mL of ethyl acetate and acidified with 1N hydrochloric acid to pH 2 (pH papers). After the phases separated, the organic layer was saved and the aqueous layer was then further extracted with ethyl acetate (3 x 100 mL).

The organic extracts were combined and washed with brine, dried with MgSO4, filtered and evaporated under vacuum to give 0.77 g (yield 82.9%) of the title compound as a foamy solid. Thin layer chromatography analysis of the title compound showed a single spot with Rf = 0.3 (silica; 90:10:2 dichloromethane/methanol/acetic acid).

99

Example 40

<u>Preparation of N-(1-butanesulfonyl)-S-methyl-L-cysteine</u> sulfone-L-proline-L-argininal

The title compound was prepared in the same manner as described in Example 8.

The compound of Example 39 was attached to the resin of Example 7. After cleavage of the title compound as a protected semicarbazone from the resin, the semicarbazone was hydrolyzed to give the title compound. 0.1 mL of thiocresol was additionally added to the anisole-HF cleavage mixture.

15 Fast atom bombardment mass spectrometry confirmed the theoretical molecular weight of 524.2.

resin, the semicarbazone was hydrolyzed to give the title compound. 0.1 mL of thiocresol was additionally added to the anisole-HF cleavage mixture.

Fast atom bombardment mass spectrometry confirmed the 5 theoretical molecular weight of 594.2.

Example 50 Preparation of S-(t-butyl acetate)-L-cysteine

A 360 mL aqueous solution of commercially available (Aldrich) L-cysteine hydrochloride monohydrate (60.0 g, 341.7 mmole) and sodium hydroxide (27.33 g, 683.4 mmole), at room temperature, was treated with a solution of t-butyl bromoacetate (72.3 g, 370.6 mmole) in 130 mL of dioxane over 30 minutes. The reaction was stirred for 18 hours, during which time a thick precipitate formed. The solid was filtered off, washed with diethyl ether (100 mL) and dried under high vacuum at 40°c to give 82.5 g (103.8% crude yield includes occluded inorganic salt) of the title compound.

Example 51

Preparation of N-Boc-S-(t-butyl acetate)-L-cysteine

5

The compound of Example 50 (82.5 g, 341.7 mmole) and sodium bicarbonate (33.96 g, 404 mmole) were suspended in 600 mL of deionized water. A solution of di-t-butyl dicarbonate (80.88 g, 370 mmole) in 350 mL of dioxane was added and the slurry was stirred for 18 hours.

The slurry was extracted with diethyl ether (2 x 100 mL). The slurry was layered with ethyl acetate (200 mL) and acidified with 1N hydrochloric acid to pH 2 (pH papers). The resulting organic layer was saved and the remaining aqueous layer was further extracted with ethyl acetate (2 x 200 mL). The organic extracts were combined, washed with brine, dried with MgSO4 and the solvent evaporated under vacuum to yield 84.3 g (74.6% yield) of the title compound as a clear oil. Thin layer chromatography analysis of the title compound showed a single spot with Rf = 0.55, (silica; 90:10:2 dichloromethane/methanol/acetic acid).

Example 52

Preparation of N-Boc-S-(t-butyl acetate)-L-cysteine-Lproline-O-benzyl ester

5

The compound of Example 51 (31.89 g, 95.06 mmole) and L-proline-O-benzyl ester hydrochloride (22.98 g, 95.06 mmole) were suspended in 140 mL of acetonitrile and 120 mL of DMF at 0°c, then BOP (42.0 g, 95.06 mmole) and NMM (28.84 g, 285.18 mmole) were added. The ice bath was removed after 30 minutes and the reaction was stirred for 18 hours at room temperature. The reaction mixture was reduced in volume under vacuum at 25°c to give an oil. The oil was dissolved in ethyl acetate (250 mL), then successively washed with 1N hydrochloric acid (1 x 50 mL), saturated sodium bicarbonate (1 x 50 mL) and brine (1 x 50 mL). The organic layer was dried with MgSO4 and evaporated under vacuum to give crude product.

The crude product was purified by column chromatography on silica gel, eluting with 55:45 hexane/ethyl acetate to yield 27.91 g (57.9% yield) of the title compound as an oil. Thin layer chromatography analysis of the title compound showed a single spot with Rf = 0.65 (silica, 3:2 ethyl acetate/hexane).

Example 53

Preparation of N-Boc-S-(t butyl acetate)-L-cysteine sulfone-L-proline-O-benzyl ester

5

The compound of Example 52 (27.9 g, 55.07 mmole) was dissolved in 300 mL of glacial acetic acid, perborate tetrahydrate (42.36 g, 275.35 mmole) was added and the mixture was heated to 55°c. After 2.5 hours at . 10 this temperature, the reaction mixture was diluted with 1 liter of brine, the aqueous layer was extracted with ethyl acetate (4 x 250 mL) and the combined organic extracts were dried with MgSO4. This solution was filtered and 15 evaporated under vacuum, then repeatedly azeotroped with toluene (200 mL) under vacuum to remove acetic acid. residual slurry was dissolved in ethyl acetate (200 mL), filtered and the filtrate evaporated to yield 29.7 g (100% yield) of the title compound as a white solid. Thin layer chromatography analysis of the title compound showed a spot with Rf = 0.60 (silica, 3:2 single acetate/hexane).

Example 54

<u>Preparation of N-benzylsulfonyl-S(t-butyl acetate)-L-</u> cysteine sulfone-L-proline-O-benzyl ester

A solution of the compound of Example 53 (5.0 g, 9.28 mmole) in 105 mL of sieve-dried ethyl acetate was prepared. To this, 26 mL of 5.7N anhydrous hydrochloric acid/ethyl acetate (that had been generated in situ from acetyl chloride and methanol) was added. This mixture was stirred for several hours at room temperature until all starting material was consumed. The mixture was evaporated under vacuum and the resulting oil was dissolved in acetonitrile and then evaporated under vacuum. This was done three times.

The remaining oil was suspended in 35 mL of acetonitrile, cooled to ice bath temperature, then benzylsulfonyl chloride (2.12 g, 11.14 mmole) and pyridine (2.93 g, 37.12 mmole) were added. The reaction was removed from the ice bath after 30 minutes and allowed stirred at room temperature for 18 hours. The reaction mixture was reduced in volume under vacuum to an oil. The oil was taken up in 200 mL ethyl acetate and washed successively with 1N hydrochloric acid (1 x 50 mL), saturated sodium bicarbonate (1 x 50 mL) and brine (1 x 50 mL). After drying with MgSO4, the organic layer was evaporated under vacuum to give crude product.

The crude product was purified by column chromato-

graphy on silica gel, eluting with 3:2 hexane/ethyl acetate to yield 2.85 g (51.8% yield) of the title compound as a solid. Thin layer chromatography analysis of the title compound showed a single spot with Rf = 0.30 (silica, 3:2 ethyl acetate/hexane).

Example 55

<u>Preparation of N-benzylsulfonyl-S-(t-butyl acetate)-L-cysteine sulfone-L-proline</u>

10

The compound of Example 54 (3.85 g, 4.81 mmole) was dissolved in THF (50 mL), 0.5 g of 10% palladium on carbon was added and the mixture was stirred under hydrogen gas at atmospheric pressure for 18 hours.

After the catalyst was filtered off the reaction mixture, the solvent was removed under vacuum and the resulting oil was taken up in a solution of saturated sodium bicarbonate. This solution was then extracted with ethyl acetate (1 x 150 mL) and the organic layer was decanted off. The remaining aqueous layer was layered with 100 mL of ethyl acetate and acidified with 1N hydrochloric acid to pH 2 (pH papers). After the phases separated, the organic layer was saved and the aqueous layer was then further extracted with ethyl acetate (3 x 100 mL).

The organic extracts were combined and washed with brine, dried with MgSO4, filtered and evaporated under 30 vacuum to give 2.1 g (yield 86.9%) of the title compound

as a foamy solid. Thin layer chromatography analysis of the title compound showed a single spot with Rf = 0.35 (silica, 90:10:2 dichloromethane/methanol/acetic acid).

5 Example 56

<u>Preparation of N-benzylsulfonyl-S-(carboxymethyl)-L-cysteine sulfone-L-proline-L-argininal</u>

The title compound was prepared in the same manner as 10 described in Example 8.

The compound of Example 55 was attached to the resin of Example 7. After cleavage of the title compound as a protected semicarbazone from the resin, the semicarbazone was hydrolyzed to give the title compound.

15 Fast atom bombardment mass spectrometry confirmed the theoretical molecular weight of 602.

Example 57

Preparation of N-(2-propylpentanov1)-S-(t-butyl acetate)-

20 L-cysteine sulfone-L-proline-O-benzyl ester

A solution of the compound of Example 53 (5.0 g, 9.28 mmole) in 105 mL of sieve-dried ethyl acetate was To this, 26 mL of 5.7N anhydrous hydrochloric acid/ethyl acetate (that had been generated in situ from acetyl chloride and methanol) was added. This mixture was stirred for several hours at room temperature until all starting material was consumed. mixture The was evaporated under vacuum and the resulting oil was 10 dissolved in acetonitrile and then evaporated under vacuum. This was done three times.

The remaining oil was suspended in 35 mL of acetonitrile, cooled to ice bath temperature, then 2-propylpentanoic acid (1.60 g, 11.4 mmole), BOP (4.10 g, 9.28 mmole) and NMM (3.75 g, 37.1 mmole) were added. The reaction was removed from the ice bath after 30 minutes and allowed stirred at room temperature for 18 hours. The reaction mixture was reduced in volume under vacuum to an oil. The oil was taken up in 200 mL ethyl acetate and washed successively with 1N hydrochloric acid (1 x 50 mL), saturated sodium bicarbonate (1 x 50 mL) and brine (1 x 50 mL). After drying with MgSO4, the organic layer was evaporated under vacuum to give crude product.

The crude product was purified by column chromato25 graphy on silica gel, eluting with 3:2 hexane/ ethyl acetate to yield 1.81 g (34.5% yield) of the title compound as a solid. Thin layer chromatography analysis of the title compound showed a single spot with Rf = 0.50 (silica, 3:2 ethyl acetate/hexane).

Example 80

Preparation of L-2-azetidinecarboxylic acid-0-benzyl ester hydrochloride salt

The compound of Example 79 (50.0g) is dissoved in 200 mL of a 4M solution of HCl in dioxine. The reaction mixture is stirred 2 hours. The solution is reduced in 10 volume under vacuum. The resulting solid is washed with diethyl ether to give the title compound.

Example 81

Preparation of L-methionine sulfone-L-2-azetidine15 carboxylic acid-O-benzyl ester hydrochloride salt

A. Procedure 1:

20 N-Boc-L-methionine sulfone-L-2-azetidinecarboxylic acid-O-benzyl ester is prepared by adding to a solution of N-Boc-L-methioninesulfone (14.0 g, 50.0 mmole) dichloromethane (150 mL) at 0°C, HOBt (10.1 g, 75 mmole) followed by DCC (11.33 g, 55.0 mmole). The mixture is 25 stirred for 10 minutes, and then the compound of Example 80 (50.0 mmole) is added followed by NMM (100 mmole, 10.9 mL). The resulting mixture is stirred in an ice bath and is allowed to come to room temperature over 12 hours. mixture is filtered to remove dicyclohexylurea and ethyl 30 acetate (300 mL) is added. The organic phase is then

added to a separatory funnel and is washed with saturated aqueous sodium bicarbonate, brine and then 1M aqueous HCl. The organic phase is dried over magnesium sulfate and then is filtered. The organic phase is reduced on a rotary evaporator under vacuum and then on a high vacuum line to remove traces of solvent to give N-Boc-L-methionine sulfone-L-2-azetidinecarboxylic acid-O-benzyl ester.

To a solution of N-Boc-L-methionine sulfone-L-2-azetidinecarboxylic acid-O-benzyl ester (50 mmole) in dry 10 dioxane (300 mL) is added 100 mL of a 4M HCl/dioxane solution. The mixture is then stirred at room temperature for 1 hour until the starting material disappears. Diethyl ether is added to the mixture to precipitate the title compound. The mixture is filtered off on a Büchner 15 funnel and dried under high vacuum to give the title compound.

B. Procedure 2:

Alternatively, the title compound is synthesized by 20 the following method.

To a solution of N-Boc-L-methionine sulfone (5 g, 20 mmole) in 80 mL of dry DMF is added compound of Example 80 (20 mmole) followed by BOP (8.9 g, 20 mmole) and NMM (5.5 mL, 20 mmole). The mixture is stirred for 16 hours at 25 room temperature. The reaction mixture is dissolved in 600 mL of ethyl acetate and is washed with 200 mL each of water, 1M aqueous HCl, water, saturated aqueous sodium bicarbonate and brine. The organic phase is dried over magnesium sulfate, filtered and the solvent is removed under vacuum to give a residue.

To the solution of the residue in 20 mL dichloromethane, 100 mL of a 4M solution of HCl in dioxane is added. After stirring for 16 hours, the solvent is removed under vacuum. The resulting residue is precipitated using diethyl ether, filtered and dried under vacuum to give the title compound.

Example 82

Preparation of N-(1-butanesulfonyl)-L-methioninesulfone-L-2-azetidinecarboxylic acid

The compound of Example 81 (12.4 mmole) is reacted with 2.07 mL (16 mmole) of 1-butanesulfonylchloride and 5.0 mL (36 mmole) of triethylamine in dichloromethane from 0°C to room temperature. The reaction mixture is poured into saturated aqueous bicarbonate and extracted with 10 ethyl acetate (2 x 100 mL). The organic phase is washed with brine and 1M aqueous HCl. The organic phase is separated and dried over magnesium sulfate, filtered and reduced under vacuum to give a residue.

The residue is mixed with 2 M potassium hydroxide (20 15 mL) and 100 mL methanol at room temperature for two hours. The methanol is reduced under vacuum and the aqueous solution is then washed with ether (2 x 50 mL) and then neutralized with 1M HCl to a pH of 1. The aqueous solution is extracted with ethyl acetate (2 x 100 mL), dried 20 over MgSO4, filtered and reduced under vacuum to give the title compound.

135

Example 83

Preparation of N-(1-butanesulfonyl)-L-methioninesulfone-L-2-azetidinecarboxylic acid-L-argininal

The title compound is prepared in the same manner as described in Example 8.

The compound of Example 82 is attached to the resin 10 of Example 7. The title compound is cleaved from the resin as a protected semicarbazone. The semicarbazone is hydrolyzed to give the title compound.

Example 84

15 <u>Preparation of N-(2-naphthylenesulfonyl)-L-methionine</u> <u>sulfone-L-2-azetidinecarboxylic acid-O-benzyl ester</u>

The compound of Example 81 (6.9 mmole) is added to 69 mL of acetonitrile. To this mixture, 2.34 g (10.3 mmole, 1.5 eq.) of 2-naphthylenesulfonylchloride and 4.20 g (4.12 mL, 34.4 mmole, 5 eq.) of pyridine are added and the mixture is stirred for 10 hours. The mixture is then concen-

trated under vacuum, diluted with ethyl acetate (500 mL) and washed with 1M HCl, water, aqueous sodium bicarbonate, and brine. The organic phase is dried over MgSO4 and concentrated under vacuum to give a residue. The residue is then filtered down a plug of silica, eluting with dichloromethane (100 mL), then 10% methanol/dichloromethane (200 mL) to give the title compound.

Example 85

10 <u>Preparation of N-(2-naphthylenesulfonyl)-L-methionine</u> <u>sulfone-L-2-azetidinecarboxylic acid</u>

The compound of Example 84 (7.1 mmole) is dissolved in 250 mL of methanol with a trace of THF. To this solution, 2 g of 10% palladium on carbon is added under a nitrogen blanket. The mixture is then stirred under hydrogen at one atmosphere of pressure for 10 hours. The mixture is filtered through a nylon filter and concentrated under vacuum to give the title compound.

20

Example 86

Preparation of N-(2-naphthylenesulfonyl)-L-methionine sulfone-L-2-azetidinecarboxylic acid-L-argininal

The title compound is prepared in the same manner as described in Example 8.

The compound of Example 85 is attached to the resin of Example 7. The title compound is cleaved from the 5 resin as a protected semicarbazone. The semicarbazone is hydrolyzed to give the title compound.

Example 87

Preparation of N-benzylsulfonyl-L-methionine sulfone-L-210 azetidinecarboxylic acid-O-benzyl ester

To a solution of the compound of Example 81 (20.0 mmole) in dry acetonitrile (100 mL) cooled to O°C, alphatoluenesulfonylchloride (20.0 mmole, 3.8 g) is added all at once followed by pyridine (50.0 mmole, 4.2 mL). The mixture is then stirred in the ice bath for 12 hours during which time the mixture is allowed to warm to room temperature.

The reaction mixture is reduced to a residue under vacuum. The residue is taken up ethyl acetate (300 mL) and washed with saturated aqueous sodium bicarbonate, brine, 1M aqueous HCl (100 mL), dried over MgSO4, filtered and evaporated under vacuum to give the title compound. The solid is filtered through a plug of silica gel (50 g) using ethyl acetate as eluent before hydrogenation to eliminate possible sulfur related impurities.

Example 88

Preparation of N-benzylsulfonyl-L-methionine sulfone-L-2-azetidinecarboxylic acid

To a solution of the compound of Example 87 (20 mmole) in methanol (300 mL), 1.0 g of 10% palladium on carbon is added. The mixture is then hydrogenated at 1 atmosphere of hydrogen gas at room temperature for 12 hours with stirring. The mixture is filtered and reduced under vacuum to give the title compound.

Example 89

15 <u>Preparation of N-benzylsulfonyl-L-methionine sulfone-L-2-</u>
azetidinecarboxylic acid-L-argininal

The title compound is prepared in the same manner as described in Example 8.

The compound of Example 88 is attached to the resin of Example 7. The title compound is cleaved from the resin as a protected semicarbazone. The semicarbazone is

hydrolyzed to give the title compound.

Example 90

Preparation of N-(2-propylpentanov1)-L-methionine sulfone-

5 L-2-azetidinecarboxylic acid-0-benzyl ester

The compound of Example 81 (4.66 mmole) is dissolved in 12 mL of 4N anhydrous hydrochloric acid/dioxane. The solution is stirred for several hours at room temperature until all starting material is consumed. The hydrochloric acid/dioxane solution is evaporated under vacuum to give a residue. The residue is dissolved in acetonitrile and evaporated under vacuum. This is done three times to give a residue.

The residue is suspended in 25 mL of acetonitrile, cooled to ice bath temperature, then 2-propylpentanoic acid (0.95 g, 6.6 mmole), BOP (2.92 g, 6.6 mmole) and NMM (2.0 g, 19,8 mmole) are added. The reaction is taken from the ice bath after 30 minutes and stirred at room temperature for 18 hours. The acetonitrile is evaporated under vacuum and the residue is taken up in ethyl acetate (200 mL) and washed successively with 1N hydrochloric acid (1 x 50 mL), saturated sodium bicarbonate (1 x 50 mL) and brine (1 x 50 mL). After drying with MgSO4, the ethyl acetate is evaporated under vacuum to yield crude product.

The crude product is purified by column chromatography on silica gel to give the title compound.

Example 91

Preparation of N-(2-propylpentanov1)-L-methionine sulfone-L-2-azetidinecarboxylic acid

The compound of Example 90 (3.64 mmole) is dissolved in THF (50 mL), 0.5 g of 10% palladium on carbon is added and the mixture is stirred under hydrogen gas at 10 atmospheric pressure for 18 hours.

After the catalyst is filtered from the reaction mixture, the solvent is removed under vacuum and the residue is taken up in a solution of saturated sodium bicarbonate. This solution is then extracted with ethyl acetate (1 x 150 mL) and the organic layer is decanted off. The remaining aqueous layer is layered with 100 mL of ethyl acetate and acidified with 1N hydrochloric acid to pH 2 (pH papers). After the phases separate, the organic layer is saved and the aqueous layer is then further extracted with ethyl acetate (3 x 100 mL).

The organic extracts are combined and washed with brine, dried with MgSO4, filtered and evaporated under vacuum to give the title compound.

Example 92

Preparation of N-(2-propylpentanovl)-L-methionine sulfone-L-2-azetidinecarboxylic acid-L-argininal

The title compound is prepared in the same manner as described in Example 8.

The compound of Example 91 is attached to the resin of Example 7. The title compound is cleaved from the resin as a protected semicarbazone. The semicarbazone is hydrolyzed to give the title compound. 0.1 mL of thiocresol is additionally added to the anisole-HF 15 cleavage mixture.

This crude product is purified by column 20 chromatography on silica gel to give the title compound.

Example 116

Preparation of N-Boc-S-(methyl acetate)-L-cysteine sulfone-L-2-azetidinecarboxylic acid-0-benzyl ester

The compound of Example 115 (31.55 mmole) dissolved in 165 mL of glacial acetic acid, perborate tetrahydrate (24.27 g, 157.75 mmole) is added and the mixture is heated to 55°C. After 2.5 hours at 5 this temperature, the reaction solution is diluted with 700 mL of brine, the aqueous layer is extracted with ethyl acetate (3 x 250 mL) and the combined organic phases are dried with MgSO4. The solution is filtered and evaporated under vacuum, then is repeatedly azeotroped with toluene 10 (200 mL) under vacuum to remove acetic acid. The residue is dissolved in ethyl acetate (200 mL), filtered and the filtrate is evaporated under vacuum to give the title compound.

15 Example 117

Preparation of N-(2-naphthylenesulfonyl)-S-(methyl acetate)-L-cysteine sulfone-L-2-azetidinecarboxylic acid-O-benzyl ester

20

25

30

The compound of Example 116 (4.8 g, 9.37 mmole) is dissolved in 18 mLοf 4N anhydrous hydrochloric acid/dioxane. The solution is stirred for several hours room temperature until all starting material The hydrochloric acid/dioxane solution consumed. evaporated under vacuum to give a residue. The residue is dissolved in acetonitrile and evaporated under vacuum. This is done three times to give a further residue.

The residue is suspended in 35 mL of acetonitrile, cooled to ice bath temperature, then 2-naphthylenesulfonyl

WO 95/28420

161

chloride (2.55 g, 11.2 mmole) and pyridine (2.2 g, 28.1 mmole) are added. The reaction is taken from the ice bath after 30 minutes and stirred at room temperature for 18 hours. The residue is taken up in 200 mL ethyl acetate, and is washed successively with 1N hydrochloric acid (1 x 50 mL) saturated sodium bicarbonate 1 x 50 mL) and brine (1 x 50 mL). After drying with MgSO4, the solvent is evaporated under vacuum to give crude product.

The crude product is purified by column 10 chromatography on silica gel to give the title compound.

Example 118

15

Preparation of N-(2-naphthylenesulfonyl)-S-(methylacetate)-L-cysteine sulfone-L-2-azetidinecarboxylic acid

CH₃
OCH₃
OCH

The compound of Example 117 (6.47 mmole) is dissolved 20 in THF (50 mL), 0.5 g of 10% palladium on carbon is added and the mixture is stirred under hydrogen gas at atmospheric pressure for 18 hours.

After the catalyst is filtered off the reaction mixture, the solvent is removed under vacuum and the residue is taken up in a solution of saturated sodium bicarbonate. This solution is then extracted with ethyl acetate (1 x 150 mL) and the organic layer is decanted off. The remaining aqueous layer is layered with 100 mL of ethyl acetate and acidified with 1N hydrochloric acid to pH 2 (pH papers). After the phases separate, the organic layer is saved and the aqueous layer is then further extracted with ethyl acetate (3 x 100 mL).

The organic extracts are combined and washed with brine, dried with MgSO4, filtered and evaporated under vacuum to give the title compound.

5 Example 119

10

Preparation of N-(2-naphthylenesulfonyl)-S-(methyl acetate)-L-cysteine sulfone-L-2-azetidinecarboxylic acid-L-argininal

The title compound is prepared in the same manner as described in Example 8.

15 The compound of Example 118 is attached to the resin of Example 7. The title compound is cleaved from the resin as a protected semicarbazone. The semicarbazone is hydrolyzed to give the title compound.

Example 120

Preparation of N-benzylsulfonyl-S-(methyl acetate)-L-cysteine sulfone-L-2-azetidinecarboxylic acid-O-benzylester

5

The compound of Example 116 (10.9 mmole) is dissolved in 18 mL of 4N anhydrous hydrochloric acid/dioxane. The solution is stirred for several hours at room temperature until all starting material is consumed. The hydrochloric acid/dioxane solution is evaporated under vacuum to give a residue. The residue is dissolved in acetonitrile and evaporated under vacuum. This is done three times to give a further residue.

The residue is suspended in 25 mL of acetonitrile, cooled to ice bath temperature, then benzylsulfonyl chloride (2.5 g, 13.1 mmole) and pyridine (2.6 g, 32.8 mmole) are added. The reaction is taken from the ice bath after 30 minutes and stirred at room temperature for 18 hours. The reaction mixture is reduced in volume under vacuum to a residue. The residue is taken up in 200 mL ethyl acetate, and is washed successively with 1N hydrochloric acid (1 x 50 mL) saturated sodium bicarbonate 1 x 50 mL) and brine (1 x 50 mL). After drying with MgSO4, the solvent is evaporated under vacuum to give crude product.

The crude product is purified by column chromatography on silica gel to give the title compound.

Example 121

Preparation of N-benzylsulfonyl-S-(methyl acetate)-Lcysteine sulfone-L-2-azetidinecarboxylic acid

The compound of Example 120 (5.12 mmole) is dissolved in THF (50 mL), 0.5 g of 10% palladium on carbon is added the mixture is stirred under hydrogen gas 10 atmospheric pressure for 18 hours.

After the catalyst is filtered off the reaction mixture, the solvent is removed under vacuum and the residue is taken up in a solution of saturated sodium bicarbonate. This solution is then extracted with ethyl 15 acetate (1 \times 150 mL) and the organic layer is decanted off. The remaining aqueous layer is layered with 100 mL of ethyl acetate and acidified with 1N hydrochloric acid to pH 2 (pH papers). After the phases separate, the organic layer is saved and the aqueous layer is then further extracted with ethyl acetate (3 x 100 mL).

The organic extracts are combined and washed with brine, dried with MgSO4, filtered and evaporated under vacuum to give the title compound.

165

Example 122

Preparation of N-benzylsulfonyl-S-(methyl acetate)-L-cysteine sulfone-L-2-azetidinecarboxylic acid-L-argininal

The title compound is prepared in the same manner as described in Example 8.

The compound of Example 121 is attached to the resin 10 of Example 7. The title compound is cleaved from the resin as a protected semicarbazone. The semicarbazone is hydrolyzed to give the title compound.

Example 123

15 <u>Preparation of N-alpha-t-butoxycarbonyl-Ng-nitro-L-arginine</u> lactam.

N-alpha-t-butoxycarbonyl-Ng-nitroarginine (2.00 g, 6.3 mmole) was dissolved in tetrahydrofuran (100 mL) by heating the solution to 50°C. The solution was allowed to cool to room temperature. N-methylpiperidine (0.84 mL, 6.9 mmole) was added, and the solution was cooled in an ice bath. Isobutylchloroformate (0.83 mL, 6.3 mmole) was added, and the reaction mixture was stirred at 0°C for 6

The reaction mixture was stirred for 18 hours while the ice in the dewar was allowed to melt overnight. The solvent was removed under vacuum. The crude product was dissolved in 20% ethyl acetate/dichloromethane (10 mL), and was purified by flash chromatography through a 3x5column of silica using gel 20% ethyl acetate/dichloromethane as eluent. 125 mL of eluent was collected. The solvent was removed under vacuum to afford 1.39 g (74% crude yield) of the title compound as a white foam. Rf 0.44 (silica gel, dichloromethane:isopropanol). Isobutanol was present as This compound may be further purified by an impurity. recrystallization from dichloromethane/hexanes ethanol/water.

15

10

Example 124

<u>Preparation</u> of N-alpha-t-butoxycarbonyl-Ng-nitro-L-argininal.

20

25

(a) Procedure 1.

To a stirred solution of LiAlH4 in tetrahydrofuran (3.8 mL of a 1.0M solution, 3.8 mmole), cooled in an ice bath, was added dropwise ethyl acetate (0.43 mL, 3.8 mmole) in tetrahydrofuran (5 mL). The solution was stirred for 30 minutes at 0°C to preform LiAlH2(OEt)2.

The solution of this LiAlH2(OEt)2 was added dropwise to a stirred solution of compound of Example 123 (0.92 g, 3.1 mmole) in tetrahydrofuran (5 mL). After 30 minutes, the reaction was quenched with 1.0N aqueous hydrochloric

acid/tetrahydrofuran (2 mL of a 1:1 mixture). aqueous hydrochloric acid (20 mL) was added, and the solution was extracted three times with ethyl acetate (20 mL each). The combined organic layers were washed with 5 water (5 mL), saturated sodium bicarbonate (5 mL) and twice with brine (2x5 mL), dried over anhydrous magnesium sulfate, filtered and the solvent was removed under vacuum to give 0.94 g (100% yield) of the title compound as an off-white solid.

10

(b) Procedure 2.

Alternatively, the title compound was made by the procedures which follow.

Preparation of N-alpha-t-butoxycarbonyl-N's-(i) 15 nitro-L-arginine-(N.O-dimethyl)hydroxylamide

A 12 liter four-necked round bottom flask equipped with an overhead stirring apparatus was flame dried under a strong stream of nitrogen. After the flask had cooled, 20 120.0 g of N-alpha-t-butoxycarbonyl-Ng-nitro-L-arginine (376 mmole, 1 equivalent) was added under a blanket of nitrogen followed by the addition of 6 liters of anhydrous tetrahydrofuran (Aldrich sure-seal) via cannula. flask was then fitted with a thermometer and the resulting 25 suspension was warmed to 50°C with a heat gun while stirring. The reaction mixture was cooled to 5°C with an ice bath and further cooled to -5°C with an ice/acetone bath.

During the time it took for this solution to reach -5°C, 36.66 g of N,O-dimethylhydroxylamine hydrochloride (376 mmole, 1.0 equivalent) was weighed out in a 500 mL flask and suspended in 300 mL of dichloromethane. suspension was sparged with nitrogen for 5 minutes, cooled to 0°C and 46 mL of N-methylpiperidine (1.0 equivalent) 35 was added via syringe under nitrogen. The mixture was sonicated briefly to insure complete dissolution/free base formation and recooled to 0°C in an ice bath while still

under nitrogen. The resulting solution of free base was used later.

When the above arginine solution had reached -5°C, 45 mL of N-methylpiperidine was added via syringe followed 5 minutes later by the addition of 46 mL of isobutyl chloroformate (0.95 equivalent) via syringe. resulting solution was stirred for 15 minutes at -5°C. After this time, the free base solution of dimethylhydroxylamine generated above was added cannula over about 15 minutes. Stirring was continued at -5°C for another 1.5 hours at which time thin layer chromatography (silica gel, 1:10:90 acetic acid/methanol/ dichloromethane) indicated that the reaction was complete. The reaction mixture was filtered while still cold, the salts washed with 400 mL of cold tetrahydrofuran and the 15 filtrate concentrated under vacuum on a rotary evaporator to yield a yellow foam.

The crude intermediate was taken up in 300 mL of dichloromethane and applied to a column of silica gel (70-230 mesh, 7x50 cm). The column was first eluted with 2 liters of dichloromethane followed by 2 liters of 2% methanol in dichloromethane. This was followed by elution with 5% methanol in dichloromethane until all of the product had been eluted (the eluent was checked for UV activity and five one-liter fractions were collected once this UV activity was apparent). Fractions containing pure product were pooled and concentrated under vacuum and placed under a high vacuum overnight to yield 120.1 g (88%. N-alpha-t-butoxycarbonyl-Ng-nitro-L-arginineyield) (N,O-dimethylhydroxylamide) as a light yellow foam. foam was taken up in 300 mL of dichloromethane, 300 mL of toluene, and the volatiles were once again removed under vacuum to remove any residual water or methanol.

10

20

(ii) Preparation of N-alpha-t-butoxycarbonyl-N9nitro-L-argininal

N-alpha-t-butoxycarbonyl-Ng-nitro-Lοf arginine-(N,O-dimethylhydroxylamide) (the product of Step (331.4 mmole) was taken up in 2.8 liters of dry (Aldrich sure-seal) tetrahydrofuran and transfered to a dry 5 liter 4-necked round bottom flask equipped with a mechanical stirrer and a low temperature thermometer. solution was cooled to -70°C with a dry ice/acetone bath 10 and 300 mL of 1M LiAlH4 in tetrahydrofuran was added by cannula transfer directly from 100 mL Aldrich sure-seal An additional 50 mLof 1M LiAlH4 bottles. tetrahydrofuran was added via syringe (total 331 mL). During the additions, the reaction temperature was kept 15 below -60°C. The reaction was stirred for 0.5 hours at -70°C, the cooling bath removed, and the reaction was slowly allowed to warm to 0°C (about 2.5 hours). Between -30°C and -20°C a thick slurry resulted. reaction mixture obtained 0°C, a small aliquot was removed and partitioned between ethyl acetate/2M 20 bisulfate. The organic layer was then analyzed by thin layer chromatography (silica gel, ethyl acetate).

When the reaction was judged to be complete, it was cooled to -70°C and 503 mL of 2M potassium bisulfate was 25 added via dropping funnel at a slow enough rate to keep the reaction temperature below -30°C. The cooling bath was removed and the reaction mixture was allowed to come to 0°C over the course of 2 hours at which time a white precipitate was filtered off. The solids were washed with tetrahydrofuran. The filtrate cold of 500 concentrated under vacuum on a rotary evaporator until most of the tetrahydrofuran was removed and the remaining white sludge was mostly aqueous. The crude product was taken up in 1.5 liters of ethyl acetate and washed with 35 0.2 M hydrochloric acid (2 x 200 mL). The hydrochloric acid extracts were back-extracted with 400 mL of ethyl acetate and the organics were combined and extracted with

 \mathcal{F}

170

saturated sodium bicarbonate (2 x 200 mL). The bicarbonate extracts were also back-extracted with 400 mL of ethyl acetate. The organics were then combined and washed with brine (200 mL) followed by drying over 5 anhydrous sodium sulfate. The solution was filtered. concentrated under vacuum on a rotary evaporator and placed on a high vacuum overnight to yield a white solid g) ο£ crude title compound. chromatographed on silica gel and eluted with a gradient 10 of 0 to 10% methanol in dichloromethane. fractions were combined and evaporated to yield the title compound as a white solid (75 g, 74%).

Example 125

15 Preparation of N-alpha-t-butoxycarbonyl-N9-nitro-L-argininal ethyl cyclol.

20 (a) Preparation A

N-alpha-t-butoxycarbonyl-Ng-nitro-L-argininal (Compound of Example 124) (41.60 g, 0.137 mole) was dissolved in ethanol (200 mL) and concentrated hydrochloric acid (1 mL) was added. After the reaction complete by TLC (silica gel, 10% methanol dichloromethane), the solvent was removed under vacuum. The crude product was purified by flash chromatography through a column of silica gel (230-400 mesh) using 0-10% ethyl acetate/dichloromethane as eluent. The combined fractions yielded 36.88 g (81%) of the title compound as pale yellow foam. $R_{f} = 0.62$ (silica gel, CH2Cl2:methanol).

PCT/US95/04954

171

(b) Preparation B

To a solution of N-alpha-t-butoxycarbonyl-Ng-nitro-Largininal (the Compound of Example 124) (170 g., 0.561 mole) and 3 liters absolute ethanol, was added 3 mL 5 concentrated hydrochloric acid. The reaction mixture was stirred overnight at 25°C. The solvent was removed under vacuum; the resulting solid was chromatographed on silica gel (70-239 mesh) and with a slow gradient of methylene chloride/ethyl acetate, 100:0 to 85:15. The 10 fractions were combined and evaporated under vacuum to yield a white foam of Ng-nitro-L-argininal ethyl cyclol (100.48 g. 64%) and 58.20 g. of fixed fractions having The TLC of the pure compound showed small impurities. isomeric products in methylene expected 2 chloride/ethyl acetate 85:15. 15

Example 126

<u>Preparation of Ng-nitro-L-argininal ethyl cyclol.</u> trifluoroacetate salt

20

A portion of Ng-nitro-L-argininal ethyl cyclol (the Compound of Example 125 (1.26 g) was treated with 50% 25 trifluoroacetic acid/dichloromethane (10 mL) for 35 minutes. The solution was added dropwise to diethyl ether (100 mL) while swirling. The resulting precipitate was filtered and washed with diethyl ether. The light yellow powder was dried under vacuum to yield (1.20g, 91%) of the 30 title compound.

172

Example 127

<u>Preparation of Ng-nitro-L-argininal ethyl cyclol.</u> hydrochloride salt.

5

(the Compound of Example 125) (35 g) in 500 mL of absolute ethanol at 0°C was added slowly 500 mL of absolute ethanol saturated with HCl(g). This mixture was allowed to warm to 25°C and progress of the reaction was checked by thin-layer chromatography. The appearance of a very polar product was the desired compound. Most of the HCl acid was removed with a stream of dry nitrogen and the organic solvent was removed under vacuum. The resulting 33 g of the title compound as a yellow-white solid was used without further purification.

Example 128

20 Preparation of p-bromobenzyl toluic acid

A 500 mL carbon tetrachloride solution of commercially available (Aldrich) p-toluic acid (20.0 g, 146.9 mmole) and AIBN (110 mg, a catalytic amount) was refluxed for 3 hours while exposed to a 250 watt Philips® heat lamp. The carbon tetrachloride was evaporated under vacuum to give crude product. The crude product was used without further purification to synthesize the compound of Example 129. NMR analysis indicates that the starting

material was almost completely consumed (>95%). Thin layer chromatography analysis of the title compound showed a spot at Rf=0.34 (silica, 95:5:1 dichloromethane/methanol/acetic acid).

5

Example 129

Preparation of p-bromobenzyl toluic acid-O-benzyl ester

10

The crude material from Example 128 (50 g total, containing approximately 34 g of product, 158 mmole) was of tetrahydrofuran, dissolved in 525 mL dicyclohexylcarbodiimide (35.9 g, 173.8 mmole), 15 dimethylaminopyridine (5.8 g, 47.4 mmole) and benzyl alcohol (51.3 g, 474 mmole) were added. The reaction was stirred for 18 hr. at room temperature. The resulting slurry was filtered and the tetrahydrofuran evaporated under vacuum.

The crude product was purified by column chromatography on silica gel, eluting with 40:60 ethyl acetate/hexane to yield 19.8 g (44.2% yield) of a white solid. Thin layer chromatography analysis of the title compound showed a single spot at Rf = 0.73 (silica, 40:60 ethyl acetate/hexane).

Example 130

Preparation of S-(p-toluic acid-O-benzyl ester)-L-cysteine

A 90 mL aqueous solution of commercially available (Aldrich) L-cysteine hydrochloride monohydrate (11.4 g, 64.9 mmole) and sodium hydroxide (5.19 g, 129.8), at room temperature, was treated with a solution of p-bromo toluic acid-0-benzyl ester (19.8 g, 64.9 mmole) in 170 mL of dioxane over 30 minutes. The reaction was stirred for 3 days at room temperature during which time a thick precipitate formed. The solid was filtered off, washed with 2:1 dioxane/water and dried under high vacuum at 40°C to give 17.8 g (78.9% crude yield includes occluded salt) of the title compound.

Example 131

15 <u>Preparation of N-Boc-S-(p-toluic acid-O-benzyl ester) -L-</u>
cysteine

The compound of Example 130 (17.4 g, 50.1 mmole) was suspended in 70 mL of saturated sodium bicarbonate/30 mL of deionized water. A solution of di-tert-butyl dicarbonate (11.2 g, 51.4 mmole) in 125 mL of dioxane was added and the slurry stirred for 2 days at room temperature.

The slurry was extracted with diethyl ether (2x100 mL). The slurry was layered with ethyl acetate (200 mL) and acidified with 3N hydrochloric acid to pH 2 (as measured by pH paper). The resulting organic layer was saved and the remaining aqueous layer was further extracted with ethyl acetate (2 x 200 mL). The organic extracts were combined, washed with brine, dried with

175

MgSO4 and the solvent evaporated under vacuum to yield 19.0 g (84.6% yield) of the title compound as a clear oil. Thin layer chromatography analysis of the title compound showed a single spot with Rf=0.30 (silica, 95:5:1 dichloromethane/methanol/acetic acid).

Example 132

Preparation of L-proline-O-FMOC hydrochloride

. 10

A 850 mL dichloromethane solution containing Boc-Lproline (49.8 g, 231.5 mmole) was treated with

15 carbonyldiimidazole (37.5 g, 231.5 mmole) and stirred for
45 minutes at room temperature. The reagent 9fluorenemethanol (50 g, 254.7 mmole) was added and the
reaction stirred overnight at room temperature. The
reaction solution was washed with 1N hydrochloric acid (1x

20 350 mL), saturated sodium bicarbonate (1x 350 mL) and
brine (1x 350 mL). The organic layer was dried with
MgSO4 and then filtered.

The organic layer was treated with 100 mL of 4N HCl in dioxane and stirred overnight at room temperature.

25 Another 100 mL of 4N HCl in dioxane was added due to incomplete reaction, and stirred overnight at room temperature. The organic layer was concentrated under vacuum to a 200 mL volume, then layered with 400 mL of ethyl ether. The immiscible layers were stirred and the 30 ether layer was decanted; this sequence was repeated twice more. Acetonitrile (100 mL) was added to the dichloromethane layer and the solvents were evaporated under vacuum to leave an oil. A semi-solid formed upon overnight standing. The solid was triturated with ethyl

176

ether (3x 150 mL), filtered and dried under vacuum to yield 63.6 g (83.3% yield) of the above-identified compound. NMR analysis was consistent with the desired product.

5

Example 133

Preparation of N-Boc-L-cysteine-S-(p-toluic acid-O-benzyl ester) -L-proline-FMOC

10

A 165 mL dimethylformamide solution containing the compound of Example 131 (18.4 g, 41.3 mmole) was treated with N-hydroxybenzotriazole (8.4 g, 62.0 mmole) and ethyl15 3- (3-dimethylamino) -propyl carbodiimide hydrochloride (11.9 g, 62.0 mmole). After the reactants had dissolved, the reaction solution was charged with 2,4,6-collidine (25.0 g, 260.5 mmole) and L-proline-FMOC hydrochloride (13.6 g, 41.2 mmole) and stirred 18 hours at room temperature.

The reaction slurry was dissolved in 600 mL of ethyl acetate, then washed with 1N hydrochloric acid (1x 200 mL), saturated sodium bicarbonate (1x 200 mL) and brine (4x 100 mL). The organic layer was dried with MgSO4, 25 filtered and evaporated under vacuum.

The crude product was purified by column chromatography on silica gel with 40:60 ethyl acetate/hexane to yield 15.5 g (52.0% yield) of a white Thin layer chromatography analysis of the title 30 compound showed a single spot with Rf=0.50 (silica, 40:60

ethyl acetate/hexane).

SUBSTITUTE SHEET (RULE 26)

177

Example 134

<u>Preparation of N-Boc-L-cysteine-S-sulfone-(p-toluic acid-O-benzyl ester) -L-proline-FMOC</u>

5

A bi-phasic solution of 40 mL carbon tetrachloride, 40 mL acetonitrile and 80 mL of deionized water containing the compound of Example 6 (14.6 g, 20.2 mmole) was treated with sodium periodate (13.0 g, 60.6 mmole) and ruthenium tri-chloride hydrate (0.03 g, 0.14 mmole). The mixture was stirred vigorously for 4 hours at room temperature.

The mixture was partitioned in water (600 mL) and ethyl ether (600 mL). The ether layer was washed with saturated sodium bicarbonate (150 mL), brine (150 mL), dried with MgSO4 and evaporated under vacuum to yield 15.2 g (100 % yield) of white solid. Thin layer chromatography analysis of the title compound showed a major spot with Rf=0.21 (40:60, ethyl acetate/hexane).

20 Example 135

Preparation of N-benzylsulfonamide-L-cysteine-S -sulfone-(p-toluic acid-O-benzyl ester) -L-proline-FMOC

A solvent of 5 ml of dichloromethane and 13 mL of 4N Hcl in dioxane containing the compound of Example 134 (6.5 g, 8.6 nmole) was stirred at room temperature for 4 hours. The solvent was evaporated under vacuum, the residue was then evaporated from acetonitrile.

The amine hydrochloride salt was dissolved in 25 mL of dimethyl formamide/acetonitrile (1:2), cooled to 0°C and charged with benzylsulfonyl chloride (2.0 g, 10.4 mmole) and 2,4,6-collidine (4.2 g, 34.5 mmole). The ice 10 bath was taken away and the reaction was stirred for 3 days. The reaction mixture was reduced in volume at 25°C to give an oil. The oil was dissolved in ethyl acetate (300 mL), then successively washed with 1N hydrochloric acid (1x 100 mL), saturated sodium bicarbonate (1x 100 mL) and brine (1x 100 mL). The organic layer was dried with MgSO4 and evaporated under vacuum to give crude product.

The crude product was purified by column chromatography on silica gel, eluting with 97:3 dichloromethane/ethyl acetate to yield 4.6 g (69.8% yield) of the title compound as solid. Thin layer chromatography analysis of the title compound showed a spot with Rf = 0.50(silica, acetate/hexane).

25 Example 136

Preparation of N-benzylsulfonamide-L-cysteine-S-sulfone (p-toluic acid-O-benyl ester)-L-proline

30

20

A 50 mL tetrahydrofuran solution containing the compound of Example 135 (4.05 g, 5.0 mmole) and piperidine

(4.1 g, 48.0 mmole) was stirred at room temperature for 1.5 hours. The reaction was concentrated under vacuum and taken up in deionized water (70 mL). The aqueous layer was extracted with ethyl acetate (3x 100 mL) to remove 5 reaction side products, then layered with ethyl acetate (100 mL) and acidified to pH 2 (as measured by pH paper) with 3N hydrochloric acid. The ethyl acetate layer was removed and the aqueous layer was extracted with ethyl acetate (2 x 100 mL). The combined organic extract 10 containing product was washed with brine (100 mL) and dried with MgSO4. The ethyl acetate was removed under vacuum to yield 2.7 g (86.8% yield) of solid. Thin layer chromatography analysis of the title compound showed a Rf=0.50 spot with (silica 15 dichloromethane/methanol/acetic acid).

Example 137

Preparation of N-benzylsulfonamide-L-cysteine-S-sulfone (p-toluic acid-O-benzyl ester)-L-proline-nitro-

20 cycloarginal (OEt)

A 6.5 mL solution of DMF/acetonitrile (40:60) containing the compound of Example 136 (1.0 g, 1.6 mmole), 25 HBTU (0.91 g, 2.4 mmole) and HOBT (0.33 g, 2.4 mmole) was stirred at 0°C for 20 minutes, then charged with Ng-nitro-L-argininal ethyl cyclol hydrochloride (the compound of Example 127) (0.56 g, 2.1 mmole) and NMM (0.89 g, 8.8 mmole). The ice bath was removed and the reaction stirred for 2 days at room temperature.

The reaction mixture was reduced in volume at 25°C to give an oil. The oil was dissolved in ethyl acetate (250 mL), then successively washed with 1N hydrochloric acid (1 x 50 mL), saturated sodium bicarbonate (1 x 50 mL) and brine (3 x 50 mL). The organic layer was dried with MgSO4 and evaporated under vacuum to give crude product.

The crude product was purified by column chromatography on silica gel, eluting with 95:5 (dichloromethane/methanol) to yield 0.77 g (57 % yield) of the title compound as a solid. Thin layer chromatography analysis of the title compound showed a single spot with Rf= 0.36 (silica, 4/1/4 dichloromethane/methanol/hexane).

Example 138

15 <u>Preparation of N-benzylsulfonamide-L-cysteine-S-sulfone</u> (p-toluic acid) -L-proline-cycloarginal(OEt) TFA salt

20 A 63 mL solution of methanol/water/acetic acid (50:10:3) containing the compound of Example 137 (0.74 g, 0.88 mmole) and 10% Pd/C catalyst (0.35 g) was hydrogenated on Parr shaker at 40 PSI hydrogen gas for 3 days at room temperature. At intermediate points, the reaction was filtered and charged with fresh catalyst. The slurry was filtered and concentrated under vacuum to a solid. The material was chromatographed by reverse phase HPLC (C-18, acetonitrile/0.1% TFA gradient) to remove impurities. The collected fractions of interest were pooled and lyophilized to yield 0.3 g (41.6% yield) of the above-identified compound as a white solid

Example 139

Preparation of N-benzylsulfonamide-L-cysteine-S-sulfone-(p-toluic acid) -L-proline-arginal aldehyde.

5

A 12 mL solution of acetonitrile/deionized water (50/50) cooled to 0°C containing the compound of Example 138 (0.3 g, 0.37 mmole) was charged with 12 mL of cold 12N 10 hydrochloric acid. The reaction was stirred at 0°C for 30 minutes, then warmed to room temperature with a total stirring time of 4 hours. The reaction was cooled to 0°C and quenched with 2.5 M sodium acetate (100 mL) to pH 5 (as measured by pH paper). The title compound was 15 isolated by reverse phase HPLC (C-18, acetonitrile/0.1 % TFA) and recovered from the pooled fractions of interest by lyophilization. Fast atom bombardment mass spectrometry confirmed the theoretical molecular weight of 678.

20 <u>Example 140</u>

<u>Preparation of N-2-propylpentylamide-L-cysteine-S-sulfone-</u> (p-toluic acid-O-benzyl ester)-L-proline-FMOC

A solution of 5 mL of dichloromethane and 13 mL of 4N HCl in dioxane containing the compound of Example 134 (6.5 g, 8.6 mmole) was stirred at room temperature for 4 hours. The solvent was evaporated under vacuum, the residue was then evaporated from acetonitrile.

A 25 mL solution of dimethylformamide/acetonitrile (1:2) containing 2-propylpentanoic acid (1.86 g, 12.9 mmole) and BOP (3.8 g, 8.6 mmole) stirred at 0°C for 30 minutes. The amine hydrochloride listed above was dissolved in a minimum amount of acetonitrile/DMF (about 5 mL) and added to the activated acid along with 2,4,6-collidine (4.2 g, 34.5 mmole). The ice bath was removed and the reaction was stirred at room temperature for 3 days. The reaction mixture was reduced in volume at 25°C to give an oil. The oil was dissolved in ethyl acetate (300 mL), then successively washed with 1N hydrochloric acid (1x 100 mL), saturated sodium bicarbonate (1x 100 mL) and brine (1x 100 mL). The organic layer was dried with MgSO4 and evaporated under vacuum to give crude product.

20 The crude product was purified by column chromatography on silica gel, eluting with 65:35 hexane/ethyl acetate to yield 4.4 g (65.4% yield) of the title compound as a solid. Thin layer chromatography analysis of the title compound showed a single spot with Rf=0.52 (silica, 3:2 ethyl acetate/hexane). 25

Example 141

Preparation of N-2-propylpentylamide-L-cysteine-S-sulfone-(p-toluic acid-O-benzyl ester)-L-proline

30

10

A 50 mL tetrahydrofuran solution containing the compound of Example 140 (4.0 g, 5.2 mmole) and piperidine (4.2 g, 49.5 mmole) was stirred at room temperature for 1.5 hours. The reaction was concentrated under vacuum and taken up in deionized water (70 mL). The aqueous layer was extracted with ethyl acetate (3 \times 100 mL) to remove reaction side products, then layered with ethyl acetate (100 mL) and acidified to pH 2 (as measured by pH papers) with 3N hydrochloric acid. The ethyl acetate layer was removed and the aqueous layer was extracted with ethyl acetate (2 x 100 mL). The combined organic extract containing product was washed with brine (100 mL) and dried with The ethyl acetate was removed under vacuum to MgSO4. yield 2.8 g (89.7% yield) of solid. chromatography analysis of the title compound showed a 15 single with Rf=0.50 (silica, spot 90:10:2 dichloromethane/methanol/acetic acid).

Example 142

20 <u>Preparation of N-2-propylpentylamide-L-cysteine-S-sulfone</u>
(p-toluic acid-O-benzyl ester)-L-proline-nitrocycloarginal(OEt)

25

A 7.4 mL solution of DMF/acetonitrile (20:80) containing the compound of Example 141 (1.2 g, 3.0 mmole), HBTU (1.15 g, 3.0 mmole) and HOBT (0.41 g, 3.0 mmole) was stirred at 0°C for 20 minutes then, charged with N g -nitro-L-argininal ethyl cyclol hydrochloride (the compound of Example 127) (0.71 g, 2.6 mmole) and NMM (1.2 g, 11.6

mmole). The ice bath was removed and the reaction stirred for 2 days at room temperature. The reaction mixture was reduced in volume at 25°C to give an oil. The oil was dissolved in ethyl acetate (250 mL), then successively washed with 1N hydrochloric acid (1x50 mL), saturated sodium bicarbonate (1 x 50 mL) and brine (3 x 50 mL). The organic layer was dried with MgSO4 and evaporated under vacuum to give crude product.

The crude product was purified by column 10 chromatography silica gel, eluting with 4:1:4 dichloromethane/methanol/hexane to yield 1.3 g (79.9% yield) of the title compound as a solid. Thin layer chromatography analysis of the title compound showed a single spot with Rf=0.50 (silica 4:1:4 dichloromethane/ methanol/hexane). 15

Example 143

Preparation of N-2-propylpentylamide-L-cysteine-S-sulfone-(p-toluic acid) -L-proline-cycloarginal(OEt) TFA salt

20

A 93 mL solution of methanol/water/acetic acid (75:15:3) containing the compound of Example 142 (1.3 g, 1.6 mmole) and 10% Pd/C catalyst (0.6 g) was hydrogenated on a Parr shaker at 40 PSI hydrogen gas for 10 days at room temperature. At intermediate points, the reaction was filtered and charged with fresh catalyst. The slurry was filtered and concentrated under vacuum to a solid.

The material was chromatographed by reverse phase HPLC (C-18, acetonitrile/0.1% TFA gradient) to remove impurities.

185

The collected fractions of interest were pooled and lyophilized to yield 0.12 g (15.1% yield) as a white solid.

Example A

Kinetic Analysis of Selected Compounds in an in vitro Thrombin Inhibition Assay

10

1. Determination of IC50.

The ability of the compounds of the present invention to act as inhibitors of thrombin and plasmin catalytic activity was assessed by determining the concentration which inhibited enzyme activity by 50%, (IC50), using the purified human enzymes.

The buffer used for all assays was HBSA (10 mM HEPES, pH 7.5, 150 mM sodium chloride, 0.1% bovine serum albumin).

The assay for IC50 determinations was conducted by combining in appropriate wells of a Corning microtiter plate, 50 microliters of HBSA, 50 microliters of the test compound at a specified concentration (covering a broad

concentration range) diluted in HBSA (or HBSA alone for Vo (uninhibited velocity) measurement), and 50 microliters of the enzyme diluted in HBSA. Following a 30 minute incubation at ambient temperature, 50 microliters of the 5 substrate at the concentrations specified below, was added to the wells yielding a final total volume microliters. The initial velocity of chromogenic substrate hydrolysis was measured by the change in absorbance at 405nm using a Thermo Max® Kinetic Microplate Reader over a 10 5 minute period in which less than 5% of the added substrate was utilized. The concentration of added inhibitor which caused a 50% decrease in the initial rate of hydrolysis was defined as the IC50 value.

15 Thrombin Assay

Thrombin catalytic activity was determined using the chromogenic substrate Pefachrome t-PA (CH3SO2-Dhexahydrotyrosine-glycyl-L-arginine-p-nitroaniline, obtained from Pentapharm Ltd.). The substrate was made up in deionized water followed by dilution in HBSA prior to 20 the assay in which the final concentration was 300 μ M (about 10-times Km). Purified human alpha-thrombin was obtained from Enzyme Research Laboratories, The enzyme was diluted into HBSA prior to the assay in which the final concentration was 0.25 nM. 25

Factor Xa Assay

Factor Xa catalytic activity was determined using the substrate, S2765 (N-alpha-benzyloxycarbonyl-D-argininyl-L-glycyl-L-arginine-p-nitroanilide dihydrochloride) which was obtained from Kabi Diagnostica. The substrate was made up in deionized water followed by dilution in HBSA prior to the assay in which the final concentration was 250 μM (about 5-times Km). Human factor Xa was prepared from purified human factor X obtained from Enzyme Research Laboratories according to the method described by Bock, P.E. et al., Archives of Biochem. Biophys. 273: 375 (1989).

204

The enzyme was diluted into HBSA prior to the assay in which the final concentration was 0.5 nM.

Plasmin Assay

5

Plasmin catalytic activity was determined using the chromogenic substrate, S-2251 [D-valyl-L-leucyl-L-lysine-pnirtoanilide dihydrochloride], which was obtained from Kabi The substrate was made up in deionized water Diagnostica. followed by dilution in HBSA prior to the assay in which 10 the final concentration was 300 μM (about 5-times Km). Purified human plasmin was obtained from Enzyme Research Laboratories, Inc. The enzyme was diluted into HBSA prior to assay in which the final concentration was 1.0 nM.

Table I below gives the IC50 values for thrombin and plasmin for selected test compounds of the present invention.

Table 1. IC50 of Preferred Compounds.

2. Determination of Inhibition constant, Ki.

The ability of the compounds of the present invention to act as inhibitors of thrombin catalytic activity was 10 assessed by determining their inhibition constant, Ki.

Enzyme activity was determined using the chromogenic (CH3SO2-D-hexahydrotyrosinesubstrate Pefachrome t-PA glycyl-L-arginine-p-nitroaniline), obtained from Pentapharm Ltd. The substrate was reconstituted in 15 deionized water prior to use. Purified human alphathrombin (3000U/mg specific activity) was obtained from Enzyme Research Laboratories, Inc. The buffer used for all assays was HBSA (10 mM HEPES, pH 7.5, 150 mM sodium chloride, 0.1% bovine serum albumin).

The assay for Ki determinations was conducted by 20 combining in appropriate wells of a Corning microtiter plate, 50 microliters of HBSA, 50 microliters of the test compound at a specified concentration diluted in HBSA (or HBSA alone for Vo(uninhibited velocity) measurement), and of the chromogenic substrate microliters 25 micromolar, 5XKm) At time zero, 50 microliters of alphathrombin diluted in HBSA, was added to the wells yielding a final concentration of 0.5 nM in a total volume of 200 Velocities of chromogenic microliters. 30 hydrolysis which occurred over 40 minutes was measured by the change in absorbance at 405 nm using a Thermo Max[®] Kinetic Microplate Reader.

Ki values were determined for test compounds using the relationships developed by Williams and Morrison,

Methods in Enzymology, 63: 437 (1979) using steady state velocities (Vs) measured over 40 minutes. The extent of substrate hydrolysis was less than 5% over the course of

206

this assay.

Table 2 below gives the Ki values for selected test compounds. The data shows their utility as potent in vitro inhibitors of human alpha-thrombin.

Example B

Ex vivo Anticoagulant Effects of BzlSO2-Met[S(O2)]-Pro-

15 Arg-al in Rat and Human Plasma

The <u>vivo</u> anticoagulant effects exof Met[S(O2)]-Pro-Arg-al was determined by measuring the prolongation of the activated partial thromboplastin time (APTT) over a broad concentration range of the added inhibitor, using pooled normal human and rat plasma. Fresh frozen citrated pooled normal human plasma was obtained from George King Biomedical, Overland Park, KA. Pooled normal rat plasma was prepared from citrated whole blood collected from anesthetized rats using standard The plasma was flash frozen and stored at procedures. 80°C until use. Measurements APTT was made using the Coag-A-Mate RA4 automated coagulometer (General Diagnostics, Organon Technica, Oklahoma City, OK) using the Automated APTT reagent (Organon Technica, Durham, NC) the as initiator of clotting according the manufacturer's instructions.

The assay was conducted by making a series of

dilutions of the test compounds in rapidly thawed plasma followed by adding 200 microliters to the wells of the assay carousel.

Figure 2 shows the anticoagulant effect of BzlSO2-Met[S(O2)]-Pro-Arg-al was measured in citrated rat (•) and human (O), plasma using this activated partial thromboplastin time (APTT) assay. The elevation in APTT due to increasing concentration of compound is presented relative to the control clotting time for rat (19.75 sec) and human (28.3 sec) plasma which is set to a value of 1.0. It is clear from these data that BzlSO2-Met[S(O2)]-Pro-Arg-al prolonged the APTT in a dose dependent manner in both rat and human plasma indicating a similar anticoagulant effect in both species of mammals.

15

Example C

Evaluation of the Antithrombotic Potential of BzlSO2-Met(S(O2))-Pro-Arg-al in an Experimental Rat Model of Thrombosis

The demonstrated anticoagulant effects of BzlSO2-Met[S(O2)]-Pro-Arg-al in both rat and human citrated plasma indicated that this compound may have potent antithrombotic effects in an experimental model of thrombosis performed in rats. To investigate this, the antithrombotic (prevention of thrombus formation) properties of this compound was evaluated using the following established experimental model of acute vascular thrombosis.

30 Rat model of FeCl3-induced platelet-dependent arterial thrombosis

This is a well characterized model of platelet dependent, arterial thrombosis which has been used in the evaluation potential antithrombotic compounds such as direct thrombin inhibitors. Kurz, K. D., Main, B. W., and Sandusky, G. E., Thromb. Res., 60: 269-280 (1990). In this model a platelet-rich, occlusive thrombus is formed

25

30

35

in a segment of the rat carotid artery treated locally with a fresh solution of FeCl3 absorbed to a piece of filter paper. The FeCl3 is thought to diffuse into the treated segment of artery and causes de-endothelialization 5 of the affected vessel surface. This results in the exposure of blood to subendothelial structures which in turn causes platelet adherence, thrombin formation and platelet aggregation resulting in occlusive thrombus formation. The effect of a test compound on the incidence of occlusive thrombus formation following the application of the FeCl3 is monitored by ultrasonic flowtometry and is used as the primary end point. The use of flowtometry to measure carotid artery blood flow, is a modification of the original procedure in which thermal detection of clot 15 formation was employed. Kurz, K. D., Main, B. W., and Sandusky, G. E., Thromb. Res., 60: 269-280 (1990).

Male Harlan Sprague Dawley rats (420-450 g) were acclimated at least 72 hours prior to use and fasted for 12 hours prior to surgery with free access to water. animals were prepared, anesthetized with Nembutal followed insertion of catheters for blood the pressure monitoring, drug and anesthesia delivery. The carotid artery was isolated by making a midline cervical incision followed by blunt dissection and spreading techniques to separate a 2 cm segment of the vessel from the carotid sheath. A silk suture was inserted under the proximal and distal ends of the isolated vessel to provide clearance for the placement of a ultrasonic flow probe (Transonic) around the proximal end of the vessel. probe was then secured with a stationary arm.

Following surgery the animals were randomized in either a control (saline) or treatment group with test compound (BzlSO2-Met[S(O2)]-Pro-Arg-al) with at least 6 animals per group per dose. The test compound was administered as a single intravenous bolus at the doses outlined in Table 3 after placement of the flow probe and 5 minutes prior to the application of the FeCl3

209

thrombogenic stimulus (t=0). At t=0, a 3mm diameter piece of filter paper (Whatman #3) soaked with 10 microliters of a 35% solution of fresh FeCl3 (made up in water) was applied the segment of isolated carotid artery distal to the flow probe. Blood pressure, blood flow, heart rate, and respiration were monitored for 60 minutes.

The incidence of occlusion (defined as the attainment of zero blood flow) was recorded as the primary end point.

The efficacy of BzlSO₂-Met[S(O₂)]-Pro-Arg-al as an an antithrombotic agent in preventing thrombus formation in this in vivo model was demonstrated by the reduction in the incidence of thrombotic occlusion as shown in Table 3 below.

15 Table 3. Results of BzlSO₂-Met[S(O₂)]-Pro-Arg-al (Test Cmpd) in the FeCl₃ Model of Thrombosis in Rats.

Treatment Group	Dose (mg/kg)	n	Incidence of Occlusion
Saline		6	6/6
Test Cmpd	0.5	6	6/6
Test Cmpd	0.75	6	2/6
Test Cmpd	1.0	6	1/6*
Test Cmpd	3.0	6	0/6*

*-p≤0.05 from saline control by Fishers test

20

The therapeutically effective amount (dose) which prevents 50% of thrombotic occlusions in this model (ED50) can be determined from the above data by plotting the incidence of occlusion versus the dose administered. This allows a direct comparison of the antithrombotic efficacy of BzlSO2-Met[S(O2]-Pro-Arg-al with other antithrombotic agents which have also been evaluated in this model as described above. Table 4 lists the ED50 values for several well known anticoagulant agents in this model

210

compared to this compound.

Table 4. Efficacy of BzlSO₂-Met[S(O₂)]-Pro-Arg-al compared to other antithrombotic agents based on ED₅₀ for thrombus prevention in the FeCl₃ model of arterial thrombosis.

Compound	Ki	ED50 ^b
	(nM)	(mg/kg)
Standard Heparin		
		300U/kg
Argatroban	19.0°	3.8mg/kg
Hirulog™	2.56d	3.0mg/kg
BzlSO2-Met[S(O2)]-Pro-Arg-al	1.06ª	0.7mg/kg

aKi determined using human alpha-thrombin as described above and in items c and d bED50 is defined as the dose that prevents the incidence of complete thrombotic occlusion in 50% of animals tested CKikumoto, R. et. al. Biochemistry 23: 85-90 (1984) dwitting, J.I. et. al. Biochem. J. 283: 737-743 (1992)

15

5

The data presented in Table 4 clearly demonstrates the effectiveness of BzlSO2-Met[S(O2)]-Pro-Arg-al preventing occlusive thrombus formation in this experimental model. The relevance of this data to preventing human thrombosis can be inferred from the comparison to the other anticoagulant agents listed in this table which have been evaluated in an identical manner in this experimental model and have demonstrated antithrombotic efficacy in preventing thrombus formation 25 clinically as described in the following literature citations: Heparin-Hirsh, J.N. Engl., J. Med 324:1565-1574 (1992) and Cairns, J.A. et. al., Chest, 102: 456S-481S (1992); Argatroban-Gold, H.K. et.al., J. Am. Cardiol., 21: 1039-1047 (1993); and HirulogTM-Sharma,

G.V.R.K. et.al., Am. J. Cardiol., <u>72</u>: 1357-1360 (1993) and Lidón, R.M. et.al., Circulation, <u>88</u>: 1495-1501 (1993).

The in vivo comparison of BzlSO2-Met[S(O2)]-Pro-Argal with the clinically effective antithrombotic agents
15 Heparin, Argatroban, and HirulogTM in the same rodent
model of experimental thrombosis coupled with the
demonstrated anticoagulant effects of BzlSO2-Met[S(O2)]Pro-Arg-al in both rat and human plasma described above in
Example B clearly suggests that this compound will be an
10 effective antithrombotic agent in humans.

212

Claims.

We claim:

5 1. A compound of the formula:

(a) X is selected from the group consisting of -C(0)-, -O-C(0)-, -NH-C(0)-, -S(O₂)-, -O-S(O₂)-, -NH-S(O₂)- and -N(R')-S(O₂)-, wherein R' is alkyl of 1 to about 4 carbon atoms, aryl of about 6 to about 14 carbon atoms, or aralkyl of about 6 to about 15 carbon atoms;

15 (b) R_1 is selected from the group consisting of:

- (1) alkyl of about 3 to about 10 carbon atoms,
- (2) alkyl of 1 to about 3 carbon atoms 20 substituted with cyclic alkyl of about 5 to about 8 carbon atoms,
 - (3) alkenyl of about 3 to about 6 carbon atoms,
- (4) alkenyl of about 3 to about 6 carbon 25 atoms which is substituted with cyclic alkyl of about 5 to about 8 carbon atoms,
 - (5) aryl of about 6 to about 14 carbon atoms,
- (6) aryl of about 6 to about 14 carbon 30 atoms which is substituted with Y_1 ,
 - (7) aryl of about 6 to about 14 carbon

PCT/US95/04954

213

atoms which is substituted with Y_1 and Y_2 , or Y_1 , Y_2 and Y_3 ,

(8) aralkyl of about 6 to about 15 carbon atoms,

5 (9) aralkyl of about 6 to about 15 carbon atoms which is substituted in the aryl ring with Y1,

(10) aralkyl of about 6 to about 15 carbon atoms which is substituted in the aryl ring with Y_1 and Y_2 , or Y_1 , Y_2 and Y_3 ,

10 (11) aralkenyl of about 8 to about 15 carbon atoms,

(12) aralkenyl of about 8 to about 15 carbon atoms which is substituted in the aryl ring with Y_1 ,

(13) aralkenyl of about 8 to about 15 carbon atoms which is substituted in the aryl ring with Y₁ and Y₂, or Y₁, Y₂ and Y₃,

(14) perfluoroalkyl of 1 to about 12 carbon atoms,

20 (15) perfluoroaryl of about 6 to about 14 carbon atoms,

(16) trimethylsilylalkyl of about 4 to about 8 carbon atoms,

(27) a substituted group of the formula

()

, wherein the aryl ring is substituted with Y₁, and X is not -O-C(O)-, NH-C(O)-, -O-S(O₂)-, -NH-S(O₂)- or -N(R')-S(O₂)-, and

10

(28) a substituted group of the formula

, wherein the aryl ring is substituted with Y₁ and Y₂, and X is not -O-C(O)-, NH-C(O)-, $-O-S(O_2)-$, -NH-S(O₂)- or -N(R')-S(O₂)-,

15

wherein

-S(O₂)-NHZ₁, -S(O₂)-NZ₁Z₂ and H , wherein Z₁, Z₂ and Z₃ are independently selected from the group consisting of trifluoromethyl, pentafluoroethyl, alkyl of 1 to about 12 carbon atoms, aryl of about 6 to about 14 carbon atoms, and aralkyl of about 6 to about 15 carbon atoms,

216

R" is alkyl of 1 to about 4 carbon atoms, aryl of about 6 to about 14 carbon atoms, or aralkyl of about 6 to about 15 carbon atoms,

A1 is aryl of about 6 to about 14 carbon atoms, aryl of about 6 to about 14 carbon atoms which is substituted with Y1, aralkyl of about 6 to about 15 carbon atoms, or aralkyl of about 6 to about 15 carbon atoms which is substituted with Y1;

(c) R2 is selected from the group consisting

10 of $-CH_2-S(O)_{\mathbf{q}}-CH_3, \\ -CH_2-S(O)_{\mathbf{q}}-(CH_2)_{\mathbf{m}}-C(O)-OH, \\ -CH_2-S(O)_{\mathbf{q}}-(CH_2)_{\mathbf{m}}-C(O)-OR', \\ -CH_2-S(O)_{\mathbf{q}}-(CH_2)_{\mathbf{m}}-C(O)-NH_2, \\ -CH_2-S(O)_{\mathbf{q}}-(CH_2)_{\mathbf{m}}-C(O)-NHR', \\ -CH_2-S(O)_{\mathbf{q}}-(CH_2)_{\mathbf{m}}-C(O)-NR'R'', \\ -CH_2-S(O)_{\mathbf{q}}-(CH_2)_{\mathbf{m}}-C(O)-NR'', \\ -C$

20

 $-CH_{2}-S(O)_{\mathbf{q}^{-}}(CH_{2})_{\mathbf{m}^{-}}A\mathbf{r}-C(O)OH,$ $-CH_{2}-S(O)_{\mathbf{q}^{-}}(CH_{2})_{\mathbf{m}^{-}}A\mathbf{r}-C(O)OR',$ $-CH_{2}-S(O)_{\mathbf{q}^{-}}(CH_{2})_{\mathbf{m}^{-}}A\mathbf{r}-C(O)NH_{2},$ $-CH_{2}-S(O)_{\mathbf{q}^{-}}(CH_{2})_{\mathbf{m}^{-}}A\mathbf{r}-C(O)NHR',$ $-CH_{2}-S(O)_{\mathbf{q}^{-}}(CH_{2})_{\mathbf{m}^{-}}A\mathbf{r}-C(O)NR'R'',$ $-CH_{2}-S(O)_{\mathbf{q}^{-}}(CH_{2})_{\mathbf{m}^{-}}A\mathbf{r}-CHN_{4},$ $-S(O)_{\mathbf{q}^{-}}CH_{3},$ $-S(O)_{\mathbf{q}^{-}}(CH_{2})_{\mathbf{m}^{-}}C(O)-OH,$ $-S(O)_{\mathbf{q}^{-}}(CH_{2})_{\mathbf{m}^{-}}C(O)-OR',$ $-S(O)_{\mathbf{q}^{-}}(CH_{2})_{\mathbf{m}^{-}}C(O)-NH_{2},$ $-S(O)_{\mathbf{q}^{-}}(CH_{2})_{\mathbf{m}^{-}}C(O)-NHR',$ $-S(O)_{\mathbf{q}^{-}}(CH_{2})_{\mathbf{m}^{-}}C(O)-NR'R'',$

 $-s(0)_{q}-(CH_{2})_{m}-Ar-C(0)OH,$

 $-s(0)_{q}-(CH_{2})_{m}-Ar-C(0)OR'$,

 $-s(0)_{G}-(CH_{2})_{m}-Ar-C(0)NH_{2}$,

 $-s(0)_{q}-(CH_2)_{m}-Ar-C(0)NHR'$,

 $-S(0)_{G}-Ar-C(0)NR'R''$, and

-S(0) g-Ar-CHN4",

wherein m is 1, 2, 3, 4, 5 or 6; q is 0, 1 or 2 and Ar is 10 a divalent aryl group of 6 to 14 carbon atoms and

(d) n is 1, 2 or 3; or pharmaceutically acceptable salts thereof.

- 2. A compound of claim 1, wherein n is 2.
- 15
 3. A compound of claim 2, wherein R_2 is $-CH_2-S(O_2)-CH_3$.
- 4. A compound of claim 3, wherein X is $-S(O_2)-$ or -C(O)-.
 - 5. A compound of claim 4, wherein X is -S(O2)-.
- 6. A compound of claim 5, wherein R1 is alkyl of about 3 to about 10 carbon atoms; alkyl of 1 to about 3 carbon atoms substituted with cyclic alkyl of about 5 to about 8 carbon atoms; aryl of about 6 to about 14 carbon atoms; aryl of about 6 to about 14 carbon atoms which is substituted with Y1; aryl of about 6 to about 14 carbon atoms which is substituted with Y1 and Y2; aralkyl of about 6 to about 15 carbon atoms; aralkyl of about 6 to about 6 to about 15 carbon atoms; aralkyl of about 6 to about 15 carbon atoms which is substituted in the aryl ring with Y1; or aralkyl of about 6 to about 15 carbon atoms which is substituted in the aryl ring with Y1; or aralkyl of about 6 to about 15 carbon atoms which is substituted in the aryl ring with Y1 and

218

Y2.

7. A compound of claim 6, wherein R₁ is aryl of about 6 to about 14 carbon atoms or aryl of about 6 to about 14 carbon atoms which is substituted with Y₁.

8. A compound of claim 7, wherein R₁ is phenyl, 2-carboxyphenyl, 2-carbomethoxyphenyl, 1-naphthyl or 2-naphthyl.

10

- 9. A compound of claim 8, wherein R1 is phenyl.
- 10. A compound of claim 8, wherein R_1 is 2-carboxyphenyl.

15

- 11. A compound of claim 8, wherein R_1 is 2-carbomethoxyphenyl.
 - 12. A compound of claim 8, wherein R1 is 1-naphthyl.

- 13. A compound of claim 8, wherein R₁ is 2-naphthyl.
- 14. A compound of claim 4, wherein X is -C(0)-.
- 25 15. A compound of claim 14, wherein R₁ is alkyl of about 3 to about 10 carbon atoms; alkyl of 1 to about 3 carbon atoms substituted with cyclic alkyl of about 5 to about 8 carbon atoms; aralkyl of about 6 to about 15 carbon atoms; aralkyl of about 6 to about 15 carbon atoms 30 which is substituted in the aryl ring with Y₁, or aralkyl of about 6 to about 15 carbon atoms substituted in the aryl ring with Y₁ and Y₂.
- 16. A compound of claim 15, wherein R_1 is alkyl of about 3 to about 10 carbon atoms.
 - 17. A compound of claim 16, wherein R₁ is 1-butyl,

1-heptyl or 4-heptyl.

- 18. A compound of claim 16, wherein R1 is 1-butyl.
- 5 19. A compound of claim 16, wherein R1 is 1-heptyl.
 - 20. A compound of claim 16, wherein R1 is 4-heptyl.
 - 21. A compound of claim 2, wherein R2 is -S(O2)-CH3.

10

- 22. A compound of claim 21, wherein X is $-S(O_2)$ -, $-NH-S(O_2)$ or -C(O)-.
 - 23. A compound of claim 22, wherein X is -S(O2)-.

- 24. A compound of claim 23, wherein R₁ is alkyl of about 3 to about 10 carbon atoms; alkyl of 1 to about 3 carbon atoms substituted with cyclic alkyl of about 5 to about 8 carbon atoms; aryl of about 6 to about 14 carbon atoms; aryl of about 6 to about 14 carbon atoms which is substituted with Y₁; aryl of about 6 to about 14 carbon atoms which is substituted with Y₁ and Y₂; aralkyl of about 6 to about 15 carbon atoms; aralkyl of about 6 to about 15 carbon atoms which is substituted in the aryl ring with Y₁; or aralkyl of about 6 to about 15 carbon atoms which is substituted in the aryl ring with Y₁ and Y₂.
- 25. A compound of claim 24, wherein R₁ is aryl of 30 about 6 to about 14 carbon atoms or aryl of about 6 to about 14 carbon atoms which is substituted with Y₁.
- 26. A compound of claim 25, wherein R₁ is phenyl, 2carboxyphenyl, 2-carbomethoxyphenyl, 1-naphthyl or 2-35 naphthyl.
 - 27. A compound of claim 26, wherein R1 is phenyl.

220

- 28. A compound of claim 26, wherein R_1 is 2-carboxylphenyl.
- 5 29. A compound of claim 26, wherein R₁ is 2-carbomethoxyphenyl.
 - 30. A compound of claim 26, wherein R_1 is 1-naphthyl.

- 31. A compound of claim 26, wherein R_1 is 2-naphthyl.
- 32. A compound of claim 2, wherein R_2 is $-S(O_2)-CH_2-15$ C(O)-OH.
 - 33. A compound of claim 32, wherein X is $-S(O_2)$ or -C(O) -
- 20 34. A compound of claim 33, wherein X is -S(O₂)-.
 - 35. A compound of claim 34, wherein R₁ is alkyl of about 3 to about 10 carbon atoms; alkyl of 1 to about 3 carbon atoms substituted with cyclic alkyl of about 5 to about 8 carbon atoms; aryl of about 6 to about 14 carbon atoms; aryl of about 6 to about 14 carbon atoms which is substituted with Y₁; aryl of about 6 to about 14 carbon atoms which is substituted with Y₁ and Y₂; aralkyl of about 6 to about 15 carbon atoms; aralkyl of about 6 to about 15 carbon atoms; aralkyl of about 6 to about 15 carbon atoms which is substituted in the aryl ring with Y₁; or aralkyl of about 6 to about 15 carbon atoms which is substituted in the aryl ring with Y₁; or aralkyl of about 6 to about 15 carbon atoms which is substituted in the aryl ring with Y₁ and Y₂.
- 36. A compound of claim 35, wherein R₁ is aryl of about 6 to about 14 carbon atoms, or aryl of about 6 to about 14 carbon atoms which is substituted with Y₁.

37. A compound of claim 36, wherein R₁ is phenyl, 2-carboxylphenyl, 2-carbomethoxyphenyl, 1-naphthyl or 2-naphthyl.

1 5

- 38. A compound of claim 37, wherein R1 is phenyl.
- 39. A compound of claim 37, wherein R₁ is 2-carboxyphenyl.

10

- 40. A compound of claim 37, wherein R₁ is 2-carbomethoxyphenyl.
- 41. A compound of claim 37, wherein R_1 is 1-15 naphthyl.
 - 42. A compound of claim 37, wherein R_1 is 2-naphthyl.
- 20 43. A compound of claim 33, wherein X is -C(0)-.
- 44. A compound of claim 43, wherein R₁ is alkyl of about 3 to about 10 carbon atoms; alkyl of 1 to about 3 carbon atoms substituted with cyclic alkyl of about 5 to about 8 carbon atoms; aralkyl of about 6 to about 15 carbon atoms; aralkyl of about 6 to about 15 carbon atoms which is substituted in the aryl ring with Y₁; or aralkyl of about 6 to about 15 carbon atoms which is substituted in the aryl ring with Y₁ and Y₂.

- 45. A compound of claim 44, wherein R₁ is alkyl of about 3 to about 10 carbon atoms.
- 46. A compound of claim 45, wherein R₁ is 1-butyl, 35 1-heptyl or 4-heptyl.
 - 47. A compound of claim 46, wherein R1 is 1-butyl.

222

- 48. A compound of claim 46, wherein R1 is 1-heptyl.
- 49. A compound of claim 46, wherein R₁ is 4-heptyl.

5

- 50. A compound of claim 2, wherein R_2 is $-S(O_2)-CH_2-C(O)-OR'$.
- 51. A compound of claim 50, wherein R' is methyl, 10 ethyl or propyl.
 - 52. A compound of claim 51, wherein R' is methyl.
- 53. A compound of claim 52, wherein X is $-S(O_2)$ or 15 -C(O) -.
 - 54. A compound of claim 53, wherein X is -S(O2)-.
- about 3 to about 10 carbon atoms; alkyl of 1 to about 3 carbon atoms substituted with cyclic alkyl of about 5 to about 8 carbon atoms; aryl of about 6 to about 14 carbon atoms; aryl of about 6 to about 14 carbon atoms; aryl of about 6 to about 14 carbon atoms which is substituted with Y1; aryl of about 6 to about 14 carbon atoms which is substituted with Y1 and Y2; aralkyl of about 6 to about 15 carbon atoms; aralkyl of about 6 to about 15 carbon atoms which is substituted in the aryl ring with Y1; or aralkyl of about 6 to about 15 carbon atoms which is substituted in the aryl ring with Y1; or aralkyl of about 6 to about 15 carbon atoms which is substituted in the aryl ring with Y1 and Y2.
 - 56. A compound of claim 55, wherein R_1 aryl of about 6 to about 14 carbon atoms or aryl of about 6 to about 14 carbon atoms which is substituted with Y_1 .

35

57. A compound of claim 56, wherein R₁ is phenyl, 2-carboxylphenyl, 2-carbomethoxyphenyl, 1-naphthyl or 2-

naphthyl.

- 58. A compound of claim 57, wherein R1 is phenyl.
- 5 59. A compound of claim 57, wherein R₁ is 2-carboxyphenyl.
 - 60. A compound of claim 57, wherein R_1 is 2-carbomethoxyphenyl.

10

- 61. A compound of claim 57, wherein R_1 is 1-naphthyl.
- 62. A compound of claim 57, wherein R_1 is 2-naphthyl.
 - 63. A compound of claim 53, wherein X is -C(0)-.
- 64. A compound of claim 63, wherein R₁ is alkyl of about 3 to about 10 carbon atoms; alkyl of 1 to about 3 carbon atoms substituted with cyclic alkyl of about 5 to about 8 carbon atoms; aralkyl of about 6 to about 15 carbon atoms; aralkyl of about 6 to about 15 carbon atoms which is substituted in the aryl ring with Y₁; aralkyl of about 6 to about 15 carbon atoms which is substituted in the aryl ring with Y₁ and Y₂.
 - 65. A compound of claim 64, wherein R_1 is alkyl of about 3 to about 10 carbon atoms.

30

- 66. A compound of claim 65, wherein R_1 is 1-butyl, 1-heptyl or 4-heptyl.
 - 67. A compound of claim 66, wherein R1 is 1-butyl.

35

68. A compound of claim 66, wherein R1 is 1-heptyl.

69. A compound of claim 66, wherein R1 is 4-heptyl.

70. A compound of claim 2 selected from the group consisting of

71. A compound of claim 2 wherein X is $-S(O_2)$ - or -C(O) -

72. A compound of claim 71 wherein R2 is

10 $-S(0)q - (CH_2)m - Ar - C(0) OH$,

 $-S(O)q - (CH_1)m - Ar - C(O) OR,$

-S(0)q - (CH₂)m - Ar - C(0) NH2,

-s(0)q - (CH₂)m - Ar - C(0) - NHR,

-S(0)q - (CH₂)m - Ar - C(0) - NHR' R'', or,

15 $-s(0)q - (CH_2)m - Ar - C(0) - CHN4$,

73. A compound according to claim wherein R₁ is a compound of claim 72, wherein R₁ is alkyl of about 3 to about 10 carbon atoms; alkyl of 1 to about 3 carbon atoms 20 substituted with cyclic alkyl of about 5 to about 8 carbon atoms; aryl of about 6 to about 14 carbon atoms; aryl of about 6 to about 14 carbon atoms which is substituted with Y₁; aryl of about 6 to about 14 carbon atoms shich is substituted with Y₁ and Y₂; aryl of about 6 to about 14

carbon atoms substitutted with Y₁, Y₂ and Y₃; aralkyl of about 6 to about 15 carbon atoms; aralkyl of about 6 to about 15 carbon atoms; aralkyl of about 6 to about 15 carbon atoms which is substituted in the aryl ring with Y₁; or aralkyl of about 6 to about 15 carbon atoms which is substituted in the aryl ring with Y₁ and Y₂ or with Y₁, Y₂ and Y₃.

74. A pharmaceutical composition for the prevention of thrombosis in a mammal suspected of having a condition characterized by abnormal thrombosis, comprising a pharmaceutically acceptable carrier and a therapeutically effective amount of the compound of claim 1, 2, 3, 21, 32, 52 or 70.

- 75. A method for the prevention of thrombosis in a mammal suspected of having a condition characterized by abnormal thrombosis, comprising administering to said mammal a therapeutically effective amount of the compound of 1, 2, 3, 21, 32, 52 or 70.
 - 76. A method for the prevention of thrombosis in a mammal suspected of having a condition characterized by abnormal thrombosis, comprising administering to said mammal a therapeutically effective amount of the pharmaceutical composition of claim 74.
